# 1 Stats

**What this section shows.** This opening section is a generated-secondary orientation surface. It collects project-scale facts, credit and license metadata, the tool-interface metaphor, and the repository module inventory generated from the frozen Lean snapshot. It is shown first so a reader can see the scope, version, graph conventions and review boundary before reading planning tables.

**Stats rule.** This opening section is a generated-secondary orientation surface. It summarizes project scale, credits, license status, root/source layout and review context, then embeds the repository module inventory and derivation graphs. None of these counts, graphs, notices, or metaphors replaces the Lean code as primary formal source, and none removes the need for discipline-specific expert review.

## Tool-interface guiding metaphor

**Guiding-metaphor rule.** Guiding metaphors are operational documentation aids. They may help identify review boundaries, hidden dependencies, and interface duties, but they are not formal CNNA theorems, ontic inputs, or substitutes for Lean-primary proof and discipline-specific expert review.

| ID                | Name                     | Metaphor                                                                                                                                                            | Mapping                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Operational consequence                                                                                                                                                                                                          | Boundary                                                                                                                                                                                     |
|-------------------|--------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GM-TOOL-INTERFACE | Tool-interface principle | The CNNA tool locally exposes an active phase as a bright object against the complementary rest of the Lean codebase and its still unaudited semantic surroundings. | Bright sector = active phase/current object;<br>dark complement = remaining Lean code, open dependencies, unreviewed theory links, and unaudited semantics;<br>boundary/interface = Master-YAML, status, object register, proof dossiers, module/import DAG and later database views;<br>DtN/Schur-like reduction = extraction of relevant dependencies, modules, handoffs and review duties;<br>noise/uncertainty = semantic errors, missing blue markings, incomplete expert review or generated-artifact defects;<br>Birdsview = database/DAG/review view over the whole formal project, still secondary. | Each active phase must make its boundary to the remaining project explicit: dependencies, module interfaces, review duties, blue/reference markings and hidden complement risks must be visible before local closure is trusted. | This is an architecture metaphor for documentation and review practice, not a formal CNNA theorem, not an ontic claim, and not a replacement for Lean-primary verification or expert review. |

### Repository module inventory and derivation graphs

**Module inventory rule.** This section is a generated repository view, not a second planning source. It is derived from the frozen SM9h Lean source snapshot by `scripts/build_export_script_v1.8.py`. The planning YAML remains the only manually maintained roadmap source; the module catalog, dependency summaries, source-path links, and graph figures are regenerated from the repository snapshot.

#### Inventory summary

| Metric                                    | Value |
|-------------------------------------------|-------|
| Lean modules                              | 287   |
| Internal import edges                     | 724   |
| External import edges                     | 43    |
| Missing internal imports                  | 0     |
| Import graph acyclic                      | True  |
| Symbol declarations detected              | 8860  |
| Symbol-reference edges detected           | 394   |
| Architectural core modules                | 241   |
| Artifact/build/notation/top-level modules | 46    |

### Module dependency graphs

#### Graph A: group-level import/dependency overview

**Arrow convention.** An edge  $A \rightarrow B$  means that at least one module in group  $A$  imports or depends on a module in group  $B$ . The arrow points from the importing/consuming group to the required dependency. This is a technical import graph, not a semantic derivation graph.

Graph B: robust semantic core mainline

**Arrow convention.** An edge  $A \rightarrow B$  means that  $B$  is the next curated semantic construction step derived from  $A$  along the robust core mainline. The arrow points in the intended derived-only construction direction. This is a semantic mainline view, not a complete import graph.

Group summary

| Group              | Modules | Internal edges | Outgoing edges | Incoming edges |
|--------------------|---------|----------------|----------------|----------------|
| Basic              | 1       | 0              | 0              | 0              |
| BuildAll           | 1       | 0              | 2              | 0              |
| Notation           | 1       | 0              | 1              | 1              |
| PillarA            | 3       | 2              | 23             | 2              |
| PillarA/Arithmetic | 127     | 348            | 16             | 2              |
| PillarA/Closure    | 4       | 5              | 2              | 5              |
| PillarA/Coupling   | 4       | 5              | 2              | 6              |
| PillarA/DtN        | 4       | 5              | 3              | 8              |
| PillarA/Finite     | 26      | 58             | 4              | 4              |
| PillarA/Foundation | 17      | 45             | 0              | 25             |
| PillarA/Geometry   | 5       | 7              | 1              | 2              |
| PillarA/Handoff    | 25      | 46             | 7              | 2              |
| PillarA/Network    | 7       | 13             | 2              | 4              |
| PillarA/Sectors    | 9       | 15             | 1              | 5              |
| PillarA/Structural | 37      | 79             | 5              | 5              |
| PillarA/ToC        | 8       | 15             | 8              | 6              |
| PillarB            | 2       | 1              | 0              | 0              |

| Group   | Modules | Internal edges | Outgoing edges | Incoming edges |
|---------|---------|----------------|----------------|----------------|
| PillarC | 2       | 1              | 0              | 0              |
| PillarD | 2       | 1              | 0              | 0              |
| PillarE | 2       | 1              | 0              | 0              |

### Import hotspots

| Module                                                         | Group              | Imports | Imported by | Transitive imports | Flags    |
|----------------------------------------------------------------|--------------------|---------|-------------|--------------------|----------|

## 2 Latest change overview

**What this section shows.** This table combines fixed metadata from the Master YAML with the latest manually recorded tool/display changes. It explains what changed in this package version and, equally important, whether the Lean-code data timestamp changed. It is displayed to prevent generated documentation changes from being mistaken for Lean-source changes.

**Latest change overview.** This section records the most recent tool/display update and the currently fixed Lean-code data timestamp. The tool version tracks generator, workflow, and PDF-display contract changes and increments by 0.01 for each such change. The Lean-code data timestamp changes only when Lean source/data changes; generator-only, YAML-policy-only, and PDF-display-only edits must not advance it.

| Item                                                    | State                                                                                                                                                                                                                                                                                                                                                 |

| Lean-code data timestamp                                | 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                                                                                                             |
| Document title                                          | CNNA Planning and Documentation Tool - Context classes plus object/phase significance tiers                                                                                                                                                                                                                                                           |
| Object/phase significance and documentation-depth tiers | V1.27 adds a second orthogonal classification axis: Context class says what a row is; Significance tier / Phase documentation tier says how deep the documentation and review obligation must be. Fundamental objects require full proof dossiers; trivial/auxiliary objects may stay mention-only unless promoted or consumed by a higher-tier gate. |
| Context-class taxonomy                                  | V1.26 adds OOP-style Context class as an orthogonal row type system for every phase/object. Second-pass semantic audit adds LeanRefactorObject, LeanHandoffContractObject and LeanGovernanceObject so Lean-facing refactors/contracts/policies cannot be confused with tool-only rows or mathematical Lean data.                                      |
| Horn quaternion/GA reference-gate integration           | V1.25 reads Horn 0709.2238v1 and routes quaternion, Pauli, Clifford/geometric-algebra, duality and biquaternion content as comparison/target gates only. No CNNA generator, Lean source, DB row or phase-release proof is introduced from the paper.                                                                                                  |
| New comparison phases                                   | Adds 1.4.9, 1.4.9.1, 1.4.9.2, 13.2.1, 13.6.1 and 18.5 for CD/Quaternion/GA, Pillar-B Pauli/Clifford, Dirac/spacetime-algebra and conformal-GA side-comparison target gates.                                                                                                                                                                           |
| New reference objects                                   | Adds GA0-GA6 as black comparison/reference objects with proof dossiers and no handoff rights. They may only be consumed as review targets once their predecessor phases expose CNNA-derived data.                                                                                                                                                     |
| Existing Supabase phase check                           | V1.24 first checks existing 20.15-20.20 DB/tooling phases and keeps them as broad architecture contracts instead of duplicating them.                                                                                                                                                                                                                 |
| Supabase live activation                                | Adds concrete execution sidechain 20.22-20.26 for discovered project aiekahdewadrejrrdajn: baseline audit, migration package, import package, explicitly authorized live execution, and post-import read-only/RLS/frontend verification.                                                                                                              |
| PDF typography profile                                  | V1.23 raises generated full/context PDF text one step: 11pt document class, one-step TeX size-command bump for generated tables/legends/static text, and larger generated graph labels where controlled by the tool.                                                                                                                                  |
| DB/publication sidechain                                | V1.22 records Supabase/Postgres as a future public read-only mirror and cnna-project.net visualization layer, not a Lean/YAML replacement.                                                                                                                                                                                                            |
| New planning phases                                     | Added 20.15-20.20 for DB schema, YAML/import roundtrip, snapshot/checksum model, public read-only API/RLS views, web-frontend contract and future reviewer/admin model.                                                                                                                                                                               |
| New guardrail                                           | Added GNG34: no Supabase row is a CNNA truth source, no public writes, no browser service__role key, and no DB update without snapshot/hash/import report.                                                                                                                                                                                            |
| Implementation status                                   | No live Supabase connection, no DB write, no frontend deployment and no Lean source change were performed in V1.22.                                                                                                                                                                                                                                   |
| Active cursor                                           | The active mathematical/content cursor is unchanged: 1.1.1.1.5.1 remains the pre-code IST source intake completeness audit.                                                                                                                                                                                                                           |

### 3 Working format and module mapping

**What this section shows.** This section records the maintained work format, root/source layout, and module-mapping assumptions. Its source is the Single-YAML-Master. It is shown because file placement, generated-output handling and source-root conventions affect every later command and review packet.

| Topic                                | Assessment                                                                                                                                                                                                                                                                          | Decision                                                                                                                                                                                                                                                                                                                                       |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Primary working format               | LaTeX, generated tables, and exported TSV files are unsuitable as primary editing sources for the roadmap.                                                                                                                                                                          | The only maintained source is masters/cnna_roadmap_master.yaml; all tables, links, and optional exports are generated from it.                                                                                                                                                                                                                 |
| Tables as single source              | Separate phase, object, and access master files drift even if their rendered tables look synchronized.                                                                                                                                                                              | phases, objects, access policy, legends, code audit, and scratch-pad records are all sections of one YAML master.                                                                                                                                                                                                                              |
| Scratch-pad synchronization          | Manual scratch-pad prose inside the .tex file causes drift.                                                                                                                                                                                                                         | The How implemented column is generated from phase_id links into implementation_scratchpad.yaml; green phases without YAML records are generator errors.                                                                                                                                                                                       |
| Code-module assignment               | Every object and phase row names the current derivation site and the neutral target module.                                                                                                                                                                                         | This makes visible whether something is derived-only, legacy-only, incomplete, or missing.                                                                                                                                                                                                                                                     |
| Subphases                            | Unlimited dot notation is allowed only when dependency depth justifies it.                                                                                                                                                                                                          | Split criterion: too many prerequisites, a deep DAG chain, different proof kinds, or a new generation layer.                                                                                                                                                                                                                                   |
| Object and phase status separated    | A shared color code hides whether an object is complete or only close.                                                                                                                                                                                                              | Object status uses W/B/G/Y/R/K. Phase status uses only G/Y/R/W with exactly one active cursor.                                                                                                                                                                                                                                                 |
| Single-master validation             | A new phase, object, or scratch-pad record must appear everywhere after generation, or generation fails.                                                                                                                                                                            | The generator validates phase IDs, object IDs, phase-object links, active cursor, scratch-pad completeness, and no manual generated columns.                                                                                                                                                                                                   |
| Roadmap horizon policy               | The full CNNA roadmap must be visible without treating distant goals as proved or implementation-ready.                                                                                                                                                                             | Short-term focus is Pillar A. Mid-term focus is Pillar B QFT and Pillar C OQS. Long-term focus is Pillar D spacetime, Pillar E matter, and explicit backreaction. External speculative theories are side-comparison targets only.                                                                                                              |
| No speculative foundation import     | Strings, loop quantum gravity, noncommutative geometry, and full ToE narratives may be useful external comparisons but must not enter the CNNA foundation as assumptions.                                                                                                           | Only established mathematics and physics objects are admitted into the derivation core. Speculative frameworks may be registered as consumer-side comparisons if they emerge from CNNA outputs.                                                                                                                                                |
| Implementation scratch-pad workflow  | A phase can be prepared from reliable mathematical/physical sources before any Lean implementation. Preparation must not be confused with closure.                                                                                                                                  | Use scratch-pad fields inside the single YAML master: source materials, extracted theory objects, dependency audit, proof rehearsal, tactic plan, guardrails, fallback layer, and post-green checks.                                                                                                                                           |
| TomS thread ingestion rule           | The thread is useful as a map of established structures, but it mixes exposition, corrections, heuristic CNNA replies, and later clarifications. It is not a source of CNNA-generative data.                                                                                        | Store extracted objects in a cross-check register, map them to phases/objects, and classify each as derived target, comparison-only target, correction, or no-action note. Use primary/authoritative sources before any formalization step.                                                                                                    |
| Legacy TeX/PDF authority cleanup     | Retaining v20/v21 TeX filenames as maintained-looking sources creates ambiguity after the YAML master becomes authoritative.                                                                                                                                                        | v22 package uses a v22 main TeX/PDF filename. Any old TeX/PDF is historical output only and should not be edited as a roadmap source.                                                                                                                                                                                                          |
| Blue-object and pruning planning     | Derived-only proofs are not enough to make an object public-final when the semantic/API boundary is still wrong. Likewise, syntactic non-use is not enough to delete.                                                                                                               | v23 introduces consumption classification, blue-object correction ledger, public API contract, and pruning ledger before any code move/deletion.                                                                                                                                                                                               |
| Implementation module manifest       | Before any code change, the plan must state exact added/modified modules, semantic placement, import direction, reuse decision, public/legacy role, consumer direction, generic finite test placement, phase type, regression mode, version impact, and mathlib/noncomputable risk. | Phase 1.1.1.1.1 closes this as a generated/validated module-manifest contract. The generator now emits a module-manifest table/TSV from scratchpad fields and validates that every scratchpad record carries the manifest fields; later code phases must fill them before Lean edits.                                                          |
| EXEC-2 rational ExecComplex boundary | ExecComplex is $\mathbb{Q} \times \mathbb{Q}$ and is suitable for integer/rational operational invariants in Phases 3-6, but not for general algebraic irrationalities such as $\sqrt{D}$ , general CM tau, algebraic eigenvalues, or non-rational lattice embeddings.              | Operational paths end at the $\mathbb{Q} \times \mathbb{Q}$ boundary. Algebraic irrationalities live only in mirror/non-operational layers. Only proved rational/integer invariants, such as discriminants, norms, rational special-angle cosines, and $h=1$ integer j-values when separately proved, may flow back into the operational path. |
| Refactor regression mode             | The Notation split touches a large import surface, so an all-at-once move risks long red intervals and consumer ambiguity.                                                                                                                                                          | Use wrapper-first incremental refactoring: add neutral wrappers beside legacy, migrate bounded consumer batches, record declaration counts/import deltas/breakage audit, and require local full-build evidence for every code package before closing a refactor phase.                                                                         |
| Lean/mathlib version policy          | Future number-theory and algebra phases may be tempted to chase newer mathlib APIs, while the current baseline is Lean 4.28.0 plus its mathlib snapshot.                                                                                                                            | Freeze to the baseline for implementation unless an explicit phase-boundary upgrade gate is opened. A version upgrade is its own review/build event; mathlib noncomputable pressure must be isolated in mirror/non-operational layers or cause a natural-source refactor, not an operational leak.                                             |
| Phase-type-specific scratchpads      | A refactor phase and a new derivation phase need different evidence. One flat scratchpad creates not-applicable ballast and misses migration metrics.                                                                                                                               | Every phase records phase_type. Refactor phases require migration/regression metrics; derivation phases require proof rehearsal/tactic/mathlib data; comparison phases require derived-only boundary; infrastructure phases must state why no operational witness is required.                                                                 |
| Governance-depth retrospective       | The deep Phase-1 governance stack is justified by the SM1-SM9h failure modes, but it must not become the project itself.                                                                                                                                                            | After the first real code-change phase 1.1.2 closes, run an explicit retrospective: identify which governance gates prevented actual errors and decide whether Phase 3+ can use a flatter max-three-level structure.                                                                                                                           |

| Topic                                                          | Assessment                                                                                                                                                                                                                                                                                                                                                                                                                                 | Decision                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase 3 to Phase 4 consumer contract                           | Phase 3 must wrap Schur/DtN before Phase 4 consumes it, but the Phase-4 generator path is the canonical operational consumer and should shape the Phase-3.6 public contract.                                                                                                                                                                                                                                                               | Phase 3.6 publishes a consumer-ready BoundaryOperatorProfile for Phase 4.1 without importing Phase 4. Phase 4 consumes that contract and must not reconstruct Schur/DtN internals or implement parallel generator logic.                                                                                                                                                                       |
| IdealThread/CutSpec.full extremal routes                       | Code confirms IdealThread is an InfiniteThread with singleton carrier per level and DirectedFamily embedding;<br>CutSpec.full is carrier := T.carrier. ExistingIdealThreadNoGo already proves the singleton route cannot generate a non-singleton carrier/boundary source.                                                                                                                                                                 | Treat IdealThread and CutSpec.full as two extremal profiles. IdealThread may supply scalar/thread-route audits;<br>full boundary/DtN matrices require full/generated boundary data. Any lifting from thread to nontrivial boundary geometry needs its own theorem and phase.                                                                                                                   |
| String-like interpretation boundary                            | The one-dimensional/string-like reading is a potentially useful physical analogy, but it is not a Lean theorem and cannot supply generative CNNA data.                                                                                                                                                                                                                                                                                     | Register the analogy only as comparison/diagnostic material under secondary long-term goals and proof dossiers. Never use it to justify a module, formula, discriminant, spectrum, or handoff without derived code evidence.                                                                                                                                                                   |
| Thread recursion versus full-boundary arithmetic provenance    | The code contains RecursiveSchurSource/MobiusTransfer/CharpolyExec chains, but the exact provenance relation between scalar recurrence, IdealThread singleton carriers, full-boundary diagonal entries, and generated boundary sources must be audited before interpretation.                                                                                                                                                              | Insert a Phase 4.0 audit before operational arithmetic wrappers. D=-3/D=-4 or CM claims may be promoted only through the operational discriminant/number-theory chain, not through analogy.                                                                                                                                                                                                    |
| Horizontal/vertical Schur-complement duality bridge order      | The algebra path and arithmetic path plausibly share Schur-complement structure, but the claim depends on separately derived horizontal sector elimination, vertical level recursion, transfermatrix data, and CD norm structure.                                                                                                                                                                                                          | Register the bridge as BR08 in Phase 10.4.1 only. It is not an input to Phase 1.4, 3, 4, 5, or 6. CD8 is deferred to Phase 10.4.2 as a corollary candidate, not a Phase-6 final theorem.                                                                                                                                                                                                       |
| One-generator Schur mechanism boundary                         | A unified Schur generator is an architectural target: the same Dirichlet-Laplacian/Schur machinery may yield horizontal algebraic and vertical arithmetic invariants. This remains a theorem obligation, not a premise.                                                                                                                                                                                                                    | Use the one-generator language only as a planning constraint and proof target. Code may share the canonical generator, but no formula may be accepted because it fits the unification story; every entry must be proof-carrying from the earlier route.                                                                                                                                        |
| Heuristic Eisenstein/Gauss lattice tests                       | Post #97 gives a useful heuristic for 120-degree Eisenstein and 90-degree Gauss spiral embeddings of a b-ary tree, but it does not define the code branching object and includes irrational/analytic targets outside ExecComplex.                                                                                                                                                                                                          | Represent this material as a consumer-only test matrix after generator/lattice/CM/j source objects exist. Use code-defined b and L_max;<br>operational rows may compute finite relations and rational/integer invariants, while tau, sqrt(D), coordinates, and analytic j stay in mirror/comparison layers.                                                                                    |
| General early finite test matrix vs. specialized sentinel rows | Eisenstein/Gauss tests are valuable early sentinels, but two special examples cannot certify that the computable path is general or non-skeletal.                                                                                                                                                                                                                                                                                          | Introduce O07 as the generic finite computation test matrix. L09/L10/M08/BR10 are specialized consumers/sentinel extensions. Every computation phase must define generic rows before or alongside sentinels.                                                                                                                                                                                   |
| Regime split for Heegner/CM test rows                          | The nine classical class-number-one/Heegner fields are number-theoretic comparison targets, but CNNA closed/unitary status is a regime statement, not a class-number statement. The noOuter empty-set REAL-root branch may have only Eisenstein/Gauss as early sentinel candidates; additional Heegner targets are naturally treated as IDEAL_infty projection/complement-family rows until proven otherwise.                              | Implement regime-typed test rows. Generic finite rows come first. Eisenstein/Gauss may be tested as noOuter-root sentinels. All other Heegner/CM targets default to HasOuter/complement-projection or comparison-only rows unless a later proof derives noOuter provenance.                                                                                                                    |
| EXEC-3 computable scalar architecture                          | ExecComplex is code-confirmed as rational pairs QxQ and maps into mathlib Complex through ExecComplexBridge. This is executable and robust for rational/integer matrix, polynomial, determinant and discriminant data, but it cannot represent general algebraic irrational coordinates such as sqrt(D) or tau. The need for a quadratic layer is therefore foreseeable;<br>the provenance question is solved by indexing it by derived D. | Keep ExecComplex as the rational operational floor. Do not expand it into a full Complex layer. Treat O09 as a required exact quadratic schema for later CM/lattice coordinates, but concrete instantiation requires O10/BR14 and a proof-carrying discriminant D-source.                                                                                                                      |
| Exact quadratic layer versus full computable Complex           | Mathlib Complex is Real x Real, and mathlib number fields/algebraic closures are formal rather than generally executable. Mathlib QuadraticAlgebra gives explicit coordinates and multiplication; AdjoinRoot demonstrates relation-generated root adjoining via quotient, but docs expose noncomputable instances that require boundary audit.                                                                                             | Implement or wrap a minimal discriminant-indexed exact quadratic schema rather than a full computable Complex. Mathlib QuadraticAlgebra may guide/wrap the schema after audit;<br>AdjoinRoot is a useful quotient/reference pattern but any noncomputable quotient/field instances must stay out of operational code unless isolated.                                                          |
| Cayley-Dickson route to C-layer noncircularity                 | The current CD code is structural and shares Schur provenance;<br>ArithmeticCDBridge explicitly records no ExecMirror-CDComplex identification without a transfer lemma. A CD-derived C surface is therefore not currently an operational scalar replacement.                                                                                                                                                                              | Do not derive the operative C-layer from Cayley-Dickson before CD7/BR08/CD8. Register CD9 as a late noncircularity audit. If proved, it may compare or bridge scalar surfaces;<br>it may not retroactively justify earlier ExecComplex or arithmetic definitions.                                                                                                                              |
| EXEC-4 derived-only exact quadratic provenance                 | The later theory will need exact quadratic data, but derived-only forbids introducing sqrt(D) as a number, axiom, or CD/Complex import. The only acceptable source is an already derived operational discriminant parameter D.                                                                                                                                                                                                             | O09 is a parameterized algebraic schema with $\theta^2 = D$ . O10/BR14 instantiate it only from O05/O06 or equivalent proof-carrying discriminant ledgers. Missing D is an upstream discriminant-source gap, not a scalar-layer patch.                                                                                                                                                         |
| PHASE-5-10 dependency bifurcation                              | v36 placed spectral/physical objects inside or behind a modular-form/j chain, even though SP0/SP1/P00-P06 consume finite boundary matrices, algebra/star/state/regime data and not j or modular forms. Phase 10 also mixed modular, transfer, spectral, analytic and bridge targets.                                                                                                                                                       | Split the post-Phase-4 roadmap into Path A (number theory -> lattice geometry -> modular/j -> analytic theta/L/class-number formula) and Path B (spectral finite profile -> finite physical/operator dynamics -> heat/spectral geometry -> transfermatrix -> late Schur/CD bridges). No object may inherit a modular-form dependency unless its proof target explicitly consumes modular data. |
| PHASE-OBJECT-LINK policy                                       | The phase table previously rendered Linked objects from direct equality object.Phase == phase.Phase only. Empty cells were often valid for umbrella, closeout, baseline or moved phases, but the view did not explain that and could be mistaken for missing objects.                                                                                                                                                                      | Every phase has an explicit Object link policy: direct, scope_only, no_direct_object, or moved. The generator renders policy-aware text and validates that direct phases have direct objects and scope-only phases have child object scope. Blank Linked objects cells are forbidden.                                                                                                          |
| ONT-1 ontic subsystem-minimality                               | Without an explicit ontic-minimality contract, later phases could silently import dynamics, environment, geometry, stochasticity, arithmetic, operator algebra or physics as primitive interpretation rather than deriving them from the subsystem/complement cut.                                                                                                                                                                         | The only primitive ontic emergence trigger is subsystem-being inside the formal IDEAL_infty provenance whole. All effective structures are derived downstream from cut, boundary, complement families, regime and Schur/DtN consequences. Physical readings are consumer interpretations, never generative inputs.                                                                             |

| Topic                                                                    | Assessment                                                                                                                                                                                                                                                                         | Decision                                                                                                                                                                                                                       |
|--------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| DB-REVIEW main side objective and database-ready planning representation | The Single-YAML-Master remains the maintained planning source, but its information should be structured so phases, objects, modules, handoffs, status colors, theory links, proof dossiers, and review paths can later be queried through a relational or graph-friendly database. | Add Phase 20 as a non-blocking main side objective. Technical database implementation is later, but schema discipline and review semantics apply immediately. YAML/PDF/TSV/DOT are generated views, not a second truth system. |
| Epistemic review status and no-infallibility maxim                       | A green Lean build proves formal consistency relative to selected definitions, not semantic infallibility of modeling choices, interpretations, or established-theory attachments. Generated artifacts can also contain semantic errors.                                           | Record the maxim that nothing is infallible and no 100-percent truth is declared. Every relevant claim remains under discipline-specific expert review, and missing blue/reference-theory markings are active audit debt.      |
| OOP-style context-class separation for phases and objects                | The previous status colors were doing two jobs: release-state signaling and, implicitly, type/context signaling. That risks a category error: a green tool/database/reference object can look like a green Lean object.                                                            | V1.26 adds Context class as an orthogonal class/type field on all phases and objects, renders it in phase/object/proof/scratchpad/module-manifest tables, and keeps status colors strictly as release/proof-state indicators.  |

4    Static code findings

**What this section shows.**    This table lists static findings discovered during repository review, implementation rehearsals and tool maintenance. Each row has a lifecycle status, addressing phase and version/timestamp. It is shown to keep known risks, closed issues and unresolved structural problems explicit rather than leaving them in chat history.

**Static finding triage rule.**    This table is sourced from the Master YAML code-audit ledger. Every static finding is a tracked issue, not loose prose. Each row records the tool/change version and timestamp at which the issue record was last materially changed. Static-finding colors are: **R/red = urgent**, **Y/yellow = critical**, **G/green = closed**. New static problems discovered during feasibility checks, implementation, or review must be added here with an ID, lifecycle status, and addressing phase before work continues.

**Table legend.**    R = red/urgent; Y = yellow/critical; G = green/closed.

| ID    | Priority | Issue status              | Addressing phase               | Change version       | Change timestamp          | Finding                                                     | Static observation                                                                                                                                                                                                                                                                 | Risk                                                                                                                                                                                                                      | Refactoring consequence                                                                                                                                                                                                                          |

| SCF08 | G        | closed-in-workflow        | 1.1.1.1.0.1; workflow_policy   | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Implementation preparation must be proof-rehearsed          | Previous SM phases often exposed missing sources only during implementation.                                                                                                                                                                                                       | The assistant may patch consumers, obstruct too early, or forget ExecComplex/import/no-go constraints.                                                                                                                    | Every phase record has preparation fields: dependency audit, source-derived theory objects, proof rehearsal, tactic plan, natural fallback source, and explicit no-go checklist.                                                                 |
| SCF09 | G        | closed-generated-view     | 1.1.1.1.4; 19.1                | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Integrated Lean module inventory                            | The SM9h snapshot contains 287 Lean modules, 724 internal import edges, zero missing internal imports, and an acyclic import graph according to build_export_script_v1.8.py.                                                                                                       | If module names and dependency structure are not visible in the planning tool, object/phase planning can drift away from the repository surface.                                                                          | The planning package now carries a generated module catalog, dependency summaries, source-path links, and graph figures derived from the repository snapshot. These are generated views, not manual planning sources.                            |
| SCF10 | Y        | open-comparison-guardrail | 8.1-8.8; 9.1-9.5; 12.1-12.8    | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | TomS thread cross-check / external-reference intake         | Thread pages 1-5 introduce prime-generation heuristics, imaginary-quadratic lattices, SL2Z/j, L-functions via modular forms, finite simple groups, Monster/Moonshine, Leech lattice and VOA/string-theory context.                                                                 | These topics are established-reference material. They must not become CNNA generators, hidden axioms, imported physical ontology, or proof shortcuts; several statements require precision corrections before formal use. | Register the material as source-audit and comparison-only objects unless a later phase derives the required CNNA object from A provenance. Add Leech/finite-simple-group/VOA/Moonshine comparison profiles after j/q-expansion, not before.      |
| SCF11 | G        | closed-routing-lock       | 1.1.1.1.0; 1.1.1.1.1-1.1.1.1.4 | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Phase 1.1 split refinement / Legacy.StatusGates quarantine  | The next frontier combines three different work kinds: declaration classification, legacy enum quarantine, true notation extraction, and import firewall verification.                                                                                                             | Keeping this as one implementation phase would recreate the previous monolith problem and make missing imports look like proof failures.                                                                                  | Split 1.1 into 1.1.1-1.1.5. Activate only 1.1.1 first; move the 749 single-constructor status enums in 1.1.2, not during inventory.                                                                                                              |
| SCF12 | G        | closed-generated-view     | 1.1.1.1.4                      | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Declaration-level consumption gap                           | Module graph reachability is strong, but declaration-level semantic consumption is not equivalent to BuildAll/Umbrella import reachability. Current snapshot: 287 Lean modules, 724 internal import edges, 8860 declarations, 394 static reference edges, 1686 referenced symbols. | A declaration can look consumed because an umbrella imports its module, while it is only a status/audit marker or phase alias. Blind pruning or blind retention would both corrupt the derived-only path.                 | Insert Phase 1.1.1.1 and LEG5 before code movement: classify declarations as core-computational, proof-bridge, public-wrapper, legacy-status, legacy-policy, phase-alias, audit-only, blue-semantic-correction, dead-candidate, or final-output. |
| SCF13 | R        | open-addressed-by-phase   | 1.1.2                          | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Single-constructor inductives are broader than status enums | A rough direct static scan finds about 872 single-constructor inductives in 99 modules; the earlier 749 figure should be treated as a narrower status-enum subset, not the full population.                                                                                        | Moving every single-constructor inductive into Legacy.StatusGates would swallow policy/proof-bridge declarations and hide real provenance.                                                                                | Phase 1.1.2 must consume the classification from 1.1.1.1/1.1.1.3. Constructor count alone is not a quarantine criterion.                                                                                                                         |

| ID    | Priority | Issue status                  | Addressing phase                                                          | Change version       | Change timestamp          | Finding                                                                    | Static observation                                                                                                                                                                                                         | Risk                                                                                                                                                                                             | Refactoring consequence                                                                                                                                                                                                     |
|-------|----------|-------------------------------|---------------------------------------------------------------------------|----------------------|---------------------------|----------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCF14 | R        | active-next                   | 1.1.1.2                                                                   | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Blue objects are proof-carrying but not public-final                       | Object status B rows occur in Cayley-Dickson, Schur/DtN, and operational arithmetic families. These are already derived-only/proof-carrying in current code, but still semantically/API unfinished.                        | Treating blue objects as final because proofs exist would export old SM/AR semantics or wrong API boundaries into Phase 3+ and handoffs.                                                         | Add Phase 1.1.1.2 and LEG7. Every blue object must get a correction ledger entry: semantic defect, natural correction phase, allowed temporary consumers, forbidden public consumers, and exit-to-white condition.          |
| SCF15 | Y        | open-addressed-by-phase       | 1.1.1.4                                                                   | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Pruning must follow API contracts, not precede them                        | Syntactic sinks and weakly referenced declarations include diagnostic leaves, audit leaves, intentional outputs, and proof-obligation terminals.                                                                           | Deleting before a public API contract can remove audit/provenance evidence or proof bridges that are not mainline outputs but still necessary.                                                   | Add Phase 1.1.1.4 and LEG8. Deletion is postponed to a later optional pruning phase and requires classification plus local green build evidence.                                                                            |
| SCF16 | G        | closed-generated-view         | 1.1.1.1.1                                                                 | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Module budget missing before implementation                                | The v23 plan classifies module/declaration consumption but did not yet require every implementation phase to name the exact modules to add/modify before Lean code is written.                                             | Kleinteilige phases can degenerate into kleinteilige code: one new file per subphase, accidental wrappers, and parallel helper modules that are syntactically green but semantically fragmented. | Insert 1.1.1.1.1 and LEG10. Every implementation phase must carry a module manifest with exact module names/count, semantic placement rationale, reuse decision, and import role before code starts.                        |
| SCF17 | G        | closed-generated-view         | 1.1.1.1.2                                                                 | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Duplicate generator risk                                                   | The Smoke-Test Generator is intended to become the canonical generator seam for the whole theory, but later phases could accidentally reimplement request/output, extraction, ledger, or smoke-test logic under new names. | Duplicate generator paths would break derived-only provenance by creating competing sources of truth and would make future proof reuse fragile.                                                  | Insert 1.1.1.1.2 and LEG11. Generator-like code must reuse or extend the canonical generator at its natural layer; parallel generators are blocked unless a genuine semantic split is recorded.                             |
| SCF18 | Y        | deferred-secondary-roadmap    | 19.1-19.4                                                                 | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Secondary derivation-graph analysis assets exist                           | repo_inventory/raw_export already contains import graph data and related forensics sufficient for future documentation coverage and derivation-geometry diagnostics.                                                       | If activated too early, graph metrics could be mistaken for CNNA-generative evidence or distract from closing operational derived objects.                                                       | Keep as secondary long-term phases 19.1-19.4; use for documentation/audit only until core derived objects and public API are stable.                                                                                        |
| SCF19 | G        | closed-policy-open-consumers  | 1.1.1.1.0.2;<br>1.2.1.2;<br>4.5.1                                         | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | ExecComplex rational ceiling                                               | ExecComplex is represented as rational pairs $Q \times Q$ ; later CM/lattice objects require algebraic or analytic data.                                                                                                   | Operational path may become a skeleton or silently import mirror/noncomputable semantics.                                                                                                        | Adopt EXEC-2: operational code carries rational/integer invariants; algebraic irrational data remains mirror-only unless a return invariant is proved.                                                                      |
| SCF20 | G        | closed-policy-open-consumers  | 1.1.1.1.0.3;<br>1.1.2-1.1.5                                               | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Refactor regression risk                                                   | Notation/alias cleanup touches a large declaration and import surface.                                                                                                                                                     | A single large move can create ambiguous red states and consumer-side patches.                                                                                                                   | Use wrapper-first bounded migrations with declaration-count, import-delta, consumer-breakage, and local full-build evidence.                                                                                                |
| SCF21 | G        | closed-policy-open-consumer   | 1.1.1.1.0.7;<br>3.0                                                       | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | IdealThread singleton collapse is code-backed                              | ToC/Contract.lean defines IdealThread.carrier L as {U.cell L}; IdealThread.family uses that carrier; deterministic coarsen_carrier_eq_prev proves coarsenSet of the next carrier is the previous singleton.                | Any plan that uses an existing IdealThread route as a nontrivial boundary matrix source would silently collapse to scalar/degenerate data.                                                       | Add S07 and BR06. Later full-boundary/DtN phases must explicitly reject IdealThread as full matrix source unless a separate lifting theorem is supplied.                                                                    |
| SCF22 | G        | closed-policy-open-consumer   | 1.1.1.1.0.7;<br>3.0                                                       | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | CutSpec.full is the maximal carrier route                                  | Finite/CutSpec.lean defines full T with carrier := T.carrier and full_carrier is rfl.                                                                                                                                      | Confusing CutSpec.full with IdealThread or with a diagonal/scalar route would erase the intended sector/interior/interface geometry.                                                             | Add S08 and require Phase 3.0 boundary-route separation before neutral Schur/DtN wrappers.                                                                                                                                  |

| SCF26 | Y        | open-addressed-by-active-phase                      | 1.1.1.2                                         | baseline-before-V1.0 | 2026-05-10T05:51:42+02:00 | Blue correction cannot rely only on status B labels                                                             | The active Phase 1.1.1.2 consumes object register rows with Object status B, but a valid LEG7 ledger must also bind each row to proof dossier, current derivation site, allowed temporary consumers, forbidden consumers, and exit-to-white condition.                                         | A proof-carrying blue object could be whitened or publicly wrapped merely because the object status row was found, without recording the exact semantic/API defect and correction phase.                               | Phase 1.1.1.2 must generate or validate a per-blue-object correction ledger, not a status-only summary. Public API and pruning phases remain blocked until that ledger is closed.                                                                                                                              |
| SCF27 | G        | closed-in-tool-v1.0-legend-policy                   | pre-1.1.1.2 tool V1.0 documentation update      | V1.0                 | 2026-05-10T05:51:42+02:00 | Generated table views needed local, section-specific legends.                                                   | Earlier rendering either lacked local legends or inserted an over-broad mixed legend. The current generator emits static/phase/object legends only where the corresponding colored cells exist.                                                                                                | Wrong or missing legend text makes color semantics ambiguous across static findings, object status, and phase status tables.                                                                                           | Use explicit legend kinds in the generator and no legend for non-status tables.                                                                                                                                                                                                                                |
| SCF28 | G        | closed-in-tool-v1.01-versioning                     | tooling/versioning-policy V1.01                 | V1.01                | 2026-05-10T06:17:44+02:00 | Tool contract version and data snapshot version were conflated as v40-v44 document increments.                  | The previous split still allowed the Lean-code data timestamp to move when only the generator/PDF display changed.                                                                                                                                                                             | A documentation-only edit could be misread as a Lean-code data change, destroying reproducible alignment between Lean snapshots and planning artifacts.                                                                | Metadata now separates tool_version, tool_change_timestamp, and data_timestamp. tool_version increments by 0.01 for tool/display changes; data_timestamp is restored and changes only with Lean code/data.                                                                                                     |
| SCF29 | G        | closed-in-tool-v1.0-static-finding-migration        | pre-1.1.1.2 tool V1.0 documentation update      | V1.0                 | 2026-05-10T05:51:42+02:00 | Essential findings front matter duplicated issue tracking outside Section 2.                                    | The v44 PDF opened with prose bullets that contained actionable workflow findings, while Section 2 was supposed to be the issue ledger.                                                                                                                                                        | Important problems can remain unprioritized, unassigned, or forgotten if they live outside the Static code findings table.                                                                                             | The separate Essential findings section was removed; the actionable content is represented as SCF rows with priority, lifecycle status, and addressing assignment.                                                                                                                                             |
| SCF30 | G        | closed-in-tool-v1.0-layout                          | pre-1.1.1.2 tool V1.0 documentation update      | V1.0                 | 2026-05-10T05:51:42+02:00 | Complete Lean module catalog: Module column could run visually into the Group column.                           | Long dotted Lean module names were emitted inside raw href cells without dot-level breakpoints and with too little Module-column width.                                                                                                                                                        | The generated module inventory becomes unreliable as a review object if readers cannot distinguish module names from group labels.                                                                                     | Module and path link text is now breakable at dots; the Module column is widened and the Group/Path widths are adjusted.                                                                                                                                                                                       |
| SCF31 | G        | closed-in-tool-v1.0-object-links                    | pre-1.1.1.2 tool V1.0 documentation update      | V1.0                 | 2026-05-10T05:51:42+02:00 | Object table A IDs were row anchors but not clickable links.                                                    | object_table_id_cell(target=True) emitted a hypertarget around plain ID text, while other object tables emitted hyperlinks to that row.                                                                                                                                                        | The first object table looked less navigable than the rest of the proofbook workflow and did not expose the proof-dossier jump from the canonical object list.                                                         | Object table A IDs now remain row anchors and additionally link to the corresponding proof-dossier target.                                                                                                                                                                                                     |
| SCF32 | G        | closed-in-tool-v1.01-legend-policy                  | tooling/static-finding-rendering V1.01          | V1.01                | 2026-05-10T06:17:44+02:00 | Global table legends were semantically over-broad.                                                              | The V1.0 generator inserted the same mixed object/phase/static legend before generated tables even when the table had no colored status cells or the section required a narrower legend.                                                                                                       | A reader could interpret colors with the wrong status system, especially static findings and phase rows.                                                                                                               | The generator now supports explicit legend kinds (static, phase, object) and emits no legend for tables without colored status/triage semantics.                                                                                                                                                               |
| SCF33 | G        | closed-in-tool-v1.01-data-timestamp-policy          | tooling/versioning-policy V1.01                 | V1.01                | 2026-05-10T06:17:44+02:00 | Lean-code data timestamp advanced during a display-only update.                                                 | The V1.0 legend-policy update reported a new data timestamp even though no Lean source file was changed.                                                                                                                                                                                       | Downstream reviewers could infer a new Lean data state from a purely presentational PDF/generator change.                                                                                                              | data_timestamp/data_version are reset to 2026-05-10T05:51:42+02:00; tool_change_timestamp records the current display-policy correction separately.                                                                                                                                                            |
| SCF34 | G        | closed-in-tool-v1.01-record-change-tracking         | tooling/table-rendering V1.01                   | V1.01                | 2026-05-10T06:17:44+02:00 | Changed static findings, scratchpad records, and object rows had no visible per-record version/timestamp field. | Before V1.01, table readers could see final status but not which tool/display version last changed the row.                                                                                                                                                                                    | Review history becomes ambiguous when a table row changes without visible version/time metadata.                                                                                                                       | Static findings expose Change version and Change timestamp. Scratchpad and object proof-link views render record metadata and default unchanged rows to unchanged-by-V1.01 / restored Lean data timestamp.                                                                                                     |
| SCF35 | G        | closed-in-tool-v1.02-pdf-navigation                 | tooling/pdf-navigation V1.02                    | V1.02                | 2026-05-10T06:27:26+02:00 | PDF navigation lacked a clickable contents page and explicit outline/bookmark tree.                             | Before V1.02, the PDF body started directly with Latest change overview and relied mainly on reader search or section scrolling. The existing hyperref setup did not expose a document-level contents page or an explicitly configured bookmark/outline tree as a reviewed navigation feature. | Long generated planning PDFs become hard to review, especially when checking sections such as Static code findings, object tables, phase tables, and scratchpad records after tool-only changes.                       | The PDF preamble now configures section-level PDF bookmarks/outline support, and the document body emits a clickable table of contents immediately after the title. This is a tool/display change only and does not advance the Lean-code data timestamp.                                                      |
| SCF36 | G        | closed-in-tool-v1.03-pre-implementation-phase-check | tooling/pre-implementation-phase-check-workflow | V1.03                | 2026-05-10T06:38:25+02:00 | Forward-looking semantic phase feasibility checks lacked an explicit workflow contract.                         | The plan had per-phase preparation fields and a pre-start feasibility rule, but no dedicated workflow for simulating several semantically connected future phases before implementation and classifying them as implementable or dependency-blocked.                                           | Without this workflow, missing dependencies can be discovered only during implementation; red findings may not automatically generate upstream addressing phases, causing late backjumps and ad hoc patching pressure. | Tool V1.03 introduces a Pre-Implementation Phase Check: inspect a semantic window as a thought experiment, mark phases Y when implementable and R when dependencies are missing, record new findings, and generate upstream addressing phases for every red result before the blocked phase can become active. |

| ID    | Priority | Issue status                                                | Addressing phase                                         | Change version | Change timestamp          | Finding                                                                                                                                           | Static observation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      | Risk                                                                                                                                                                                                                  | Refactoring consequence                                                                                                                                                                                                                                                                                 |
|-------|----------|-------------------------------------------------------------|----------------------------------------------------------|----------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCF37 | G        | closed-in-tool-v1.04-implementation-scaling-plan            | tooling/<br>implementation-scaling-phase-plan V1.04      | V1.04          | 2026-05-10T06:58:41+02:00 | The tool lacked an explicit phase roadmap for scalable CNNA object-world growth without overloading Lean implementation work.                     | Previous workflows defined phase checks and ledgers, but did not yet separate lean-focus packets, local module-theory context, large end-theory comparison ledgers, incremental cache, object graph slices, and automatic red-blocker prephases into implementation phases.                                                                                                                                                                                                                                                             | Without this roadmap, future requests could drift into manual PDF/table maintenance, excessive context scanning, or ambiguous treatment of established theories during Lean-code work.                                | Tool V1.04 adds future phases under 1.1.1.5 and a generated implementation-scaling plan. These phases preserve the active 1.1.1.2 cursor and keep Lean-data timestamp fixed.                                                                                                                            |
| SCF38 | G        | closed-in-tool-v1.05-preimplementation-window-result-ledger | tooling/<br>pre-implementation-check-result-ledger V1.05 | V1.05          | 2026-05-10T07:12:27+02:00 | Requested semantic phase-window implementability checks had no persistent result table.                                                           | Tool V1.03 defined the pre-implementation thought-experiment workflow, but the concrete result of a requested check window was not yet rendered as a dedicated generated ledger with phase-level Y/R decisions.                                                                                                                                                                                                                                                                                                                         | Feasibility conclusions could remain only in chat prose, making later phase activation ambiguous and weakening the red-blocker-to-addressing-phase discipline.                                                        | Tool V1.05 adds a <code>pre_implementation_phase_check_results</code> section, generator validation, TSV export, and PDF rendering for the checked window. The 1.1.1.2-1.1.1.5 window is recorded as yellow/implementable under sequential closure assumptions, with no red addressing phase generated. |
| SCF39 | G        | closed-in-tool-v1.06-preimplementation-status-refinement    | tooling/<br>pre-implementation-check-refinement V1.06    | V1.06          | 2026-05-10T07:22:31+02:00 | Pre-implementation check status Y was too coarse and conflated active implementability with later implementability in a derivation chain.         | The V1.05 check correctly treated 1.1.1.3-1.1.1.5 as implementable only under predecessor-closure assumptions, but the table still marked every implementable row yellow.                                                                                                                                                                                                                                                                                                                                                               | Readers could mistake later chain-dependent phases for immediately active implementable phases, weakening the one-active-phase invariant and obscuring predecessor assumptions.                                       | Tool V1.06 introduces G/Y/O/R check semantics plus Check mode, Implementability scope, Required predecessor closures, Assumptions, Evidence basis, Lean proof risk, Parent/subphase rule, and Would-generate-addressing-phase fields.                                                                   |
| SCF40 | G        | closed-in-tool-v1.06-phase-legend-synchronization           | tooling/<br>phase-logic-legends V1.06                    | V1.06          | 2026-05-10T07:22:31+02:00 | Tables that use phase logic needed legends synchronized with the new orange derivation-chain implementability status.                             | The prior phase and pre-implementation legends exposed only green/white/yellow/red or yellow/red meanings and did not explain the new chain-dependent implementability state.                                                                                                                                                                                                                                                                                                                                                           | Even with correct result rows, inconsistent legends would make the PDF display ambiguous and could lead to wrong activation of a non-current phase.                                                                   | The generator now emits updated phase-logic legends: G = closed/derived-only, W = not yet checked where actual roadmap statuses appear, O = implementable in derivation chain, Y = active implementable now, R = blocked with missing dependencies and mandatory upstream addressing phase.             |
| SCF41 | G        | closed-in-tool-v1.07-db-review-main-side-objective          | 20;<br>20.1                                              | Tool V1.07     | 2026-05-10T07:39:10+02:00 | Database-ready review/documentation structure was only a prose idea, not a first-class main side objective.                                       | The prior YAML had secondary long-term goals and generated views, but no main phase route for database-ready review structure, round-trip schema discipline, and expert-review semantics.                                                                                                                                                                                                                                                                                                                                               | The DB direction could be treated as optional late tooling and fail to constrain current YAML/schema/review practices.                                                                                                | Add Phase 20 DB-REVIEW with child phases, direct DBR objects, scratchpads, secondary-goal row, workflow row, and immediate guardrails. No Lean source changes.                                                                                                                                          |
| SCF42 | G        | closed-in-tool-v1.07-expert-review-guardrail                | 20.1;<br>GNG23;<br><code>workflow_policy</code>          | Tool V1.07     | 2026-05-10T07:39:10+02:00 | Generated documentation lacked an explicit global no-infallibility and discipline-specific expert-review rule.                                    | The tool distinguished Lean code from generated views, but did not yet force the stronger epistemic maxim that even green Lean builds and generated artifacts remain semantically reviewable.                                                                                                                                                                                                                                                                                                                                           | Planning tables or green builds could be overread as 100-percent secured truth, especially around established-theory/reference material that may still lack blue marking.                                             | Add GNG23 and the DB-REVIEW workflow: Lean code is primary but not semantically infallible; generated artifacts are secondary; expert review is always required; missing blue markings are audit debt.                                                                                                  |
| SCF43 | Y        | active-in-phase-1.1.1.1.5.1                                 | 1.1.1.1.5.1-1.1.1.1.5.5                                  | V1.12          | 2026-05-10T11:16:00+02:00 | New substantive Lean code should wait until semantically related module families have been audited for consolidation or explicit no-merge status. | The repository has a valid import graph, but it still contains visibly related micro-modules and clone-like wrappers. Existing phases covered reuse/generator policy and declaration consumption, but not a dedicated pre-substantive module-consolidation/no-merge ledger.                                                                                                                                                                                                                                                             | Without this gate, new code may be built on duplicate or unstable import surfaces, making later public API correction, blue-object review, and refactor migration harder.                                             | V1.21 routes this finding through the full readiness chain: source intake, neutral naming/facade plan, refactor execution, post-refactor re-scan, and release proof before 1.1.1.2.                                                                                                                     |
| SCF44 | Y        | prepared-after-source-intake                                | 1.1.1.1.5.2-1.1.1.1.5.3                                  | V1.12          | 2026-05-10T11:16:00+02:00 | High-confidence schema/clone families were found in BoundarySource substrate ledgers and Handoff input/output wrappers.                           | BoundaryStateSubstrate, BranchAddressSubstrate, HistoryExpandedSubstrate, and InterfaceExposureSubstrate share the same import, ledger projection pattern, blocker/status/obligation theorems, and StrengtheningAR2b1 wrappers. <code>A_to_C</code> , <code>A_to_D</code> , <code>A_to_E</code> are SectorExportStrong aliases with identical of export projections. <code>B_to_A</code> , <code>C_to_A</code> , <code>D_to_A</code> , <code>E_to_A</code> share the same source/feedback structure, ext proof, and handoff projection. | Leaving these as unrelated modules can obscure the true shared schema and make future public API/firewall decisions noisier; merging them unsafely could still break existing imports or erase pillar-specific names. | After LEG37 closes, LEG38 must decide schema/facade/no-merge treatment; any actual code change moves through LEG39 with old-module facades and local build evidence.                                                                                                                                    |
| SCF45 | Y        | prepared-after-source-intake                                | 1.1.1.1.5.2                                              | V1.12          | 2026-05-10T11:16:00+02:00 | Long SM/generated proof chains and Cayley-Dickson S6 chains are not safe merge candidates merely because they are numerous or similarly named.    | The Smoke/GeneratedInterior*/Operational* modules and Structural/CayleyDickson/S6* modules encode phase/proof progression and consumer history. Their boundaries may carry provenance, debugging, or theorem-staging information even if some boilerplate repeats.                                                                                                                                                                                                                                                                      | Aggressive consolidation could reduce auditability, hide natural proof boundaries, or create a large monolith that is harder for experts to review.                                                                   | LEG38 must explicitly classify these as no-merge-until-proven unless a canonical proof module preserves provenance and passes import/declaration regression checks.                                                                                                                                     |

| ID    | Priority | Issue status                | Addressing phase        | Change version | Change timestamp          | Finding                                                                                                                                                                             | Static observation                                                                                                                                                                                                                                                                      | Risk                                                                                                                                                                                                                 | Refactoring consequence                                                                                                                                                                                                                                  |
|-------|----------|-----------------------------|-------------------------|----------------|---------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCF46 | G        | closed-by-V1.13-policy      | 20.8                    | V1.13          | 2026-05-10T11:26:00+02:00 | The project root had accumulated generated documentation artifacts and historical Markdown reports, obscuring the source/secondary-artifact boundary.                               | Root inspection of the V1.12 package found 36 Markdown reports, 20 PDFs, 20 TeX files, 19 aux files, 22 logs, 8 out files, 11 toc files, and additional latexmk artifacts at maxdepth 1. These files are not Lean sources and are reproducible or archival documentation surfaces.      | Root clutter can make generated-secondary artifacts look like authoritative inputs, increases package size, and weakens the Single-YAML-Master / Lean-primary discipline.                                            | Keep README.md in root; archive historical Markdown reports; remove generated PDF/TeX/LaTeX build products from root; use scripts/generate_full_document.py for disposable full documentation and scripts/clean_generated_root_artifacts.py for cleanup. |
| SCF47 | G        | closed-by-V1.15-policy      | 20.10                   | V1.15          | 2026-05-10T12:20:00+02:00 | The V1.14 root policy was too narrow because Lean/Lake project-control files must live in the package/project root for reproducible local builds.                                   | User supplied CNNA.lean, lakefile.lean, lake-manifest.json and lean-toolchain. The lakefile points the CNNA library to Repository/repo_snapshot, while the manifest/toolchain pin the Lean/mathlib build environment.                                                                   | If root cleanup deletes or omits these files, the package remains documentable but loses its direct local Lake build entry and reproducibility surface.                                                              | Amend DBR8/GNG27 by DBR10/GNG28: root is source/control oriented, not README-only. Keep package-root Lean/Lake build files; continue excluding generated PDF/TeX/build artifacts and historical reports from active root.                                |
| SCF48 | G        | closed-by-tooling-phase     | 20.11                   | V1.17          | 2026-05-10T12:58:00+02:00 | Root license/credit and duplicate-README surface needed explicit closure                                                                                                            | V1.16 had README copies in both package root and Repository/, and no root LICENSE file. User required root-only README, root license file, and explicit editor/assistant credits also in generated PDFs.                                                                                | Without closure, release packages could present ambiguous entry surfaces and generated PDFs could lose attribution/license context.                                                                                  | V1.17 keeps README.md and LICENSE only in package root, removes duplicate README files, updates PDF generators and metadata credits, and records GNG29/DBR11.                                                                                            |
| SCF49 | G        | closed-by-tooling-phase     | 20.12                   | V1.18          | 2026-05-10T13:18:00+02:00 | Generated documentation sections needed stronger visual separation for review navigation                                                                                            | V1.17 full and context PDFs rendered consecutive top-level sections without a uniform automatic pagebreak invariant; individual manual clearpages existed only around the table of contents or specific generator positions.                                                            | Large review packets become harder to navigate and section boundaries can be visually blurred, especially in context-filtered documents that preserve all major sections but show sparse rows.                       | V1.18 adds a generator-level section hook so every top-level full/context documentation section starts on a fresh page. The change is layout-only and does not alter Lean, YAML row semantics, context filtering, or proof status.                       |
| SCF50 | G        | closed-by-tooling-phase     | 20.13                   | V1.19          | 2026-05-10T13:45:00+02:00 | White phase status was too permissive for unreleased Lean-derivation phases                                                                                                         | V1.18 had many W phases with implementation_scratchpad.phase_type = derivation, so W still meant unchecked/future rather than non-Lean/tooling-only. User required unreleased Lean-derivation phases to default red until their release is proven from derived-only Lean objects.       | Without this policy, a future Lean-content phase can look merely inactive/white instead of explicitly locked, weakening the derived-only partial-order discipline and hiding missing prerequisite-object evidence.   | V1.19 converts all W derivation phases to R, redefines W for non-direct-Lean work, and patches generator validation to reject any future W derivation phase.                                                                                             |
| SCF51 | G        | closed-by-tooling-phase     | 20.14                   | V1.20          | 2026-05-10T13:52:00+02:00 | Implementation module manifest could be misread as a second phase table and section/table purposes were underexplained                                                              | V1.19 still presented the module manifest in the main reading flow and several sections relied on terse table-local paragraphs. User reported confusion and requested clearer static explanations with dynamic table contents only.                                                     | Readers may confuse module/API change planning with phase-release logic, or miss where data comes from and why a table is shown.                                                                                     | V1.20 renames and moves the manifest to a technical appendix, clarifies its use boundary, and adds static source/purpose explanations around the full and context documentation sections.                                                                |
| SCF52 | Y        | active-in-phase-1.1.1.1.5.1 | 1.1.1.1.5.1-1.1.1.1.5.5 | V1.21          | 2026-05-10T14:20:00+02:00 | Pre-code readiness was too broad: semantic consolidation alone did not prove that all current modules were neutralized, refactored and classified before new substantive Lean code. | V1.20 had active 1.1.1.1.5 and orange 1.1.1.2, while many required neutralization/refactor/object-intake phases remained white planning/refactor rows. The codebase still contains phase-semantic SM*/S6*/StrengtheningPhase names and 8860 declarations needing stable classification. | If 1.1.1.2 starts too early, blue-object correction may be built on unstable module names, incomplete IST-object intake, stale public/API surfaces or unclassified proof-stage modules.                              | V1.21 splits 1.1.1.1.5 into a five-step readiness chain and makes 1.1.1.2 depend on the final release certificate.                                                                                                                                       |
| SCF53 | G        | closed-as-planning-record   | 20.15-20.20             | V1.22          | 2026-05-10T14:55:00+02:00 | Database/public-web vision needed explicit non-truth-source planning phases before any direct DB work.                                                                              | SLTG-06 already described database-ready documentation, but Supabase/Postgres public read-only mirror, snapshot provenance, RLS/views and cnna-project.net frontend contract were not yet split into concrete planning phases.                                                          | Without explicit phases and guardrails, a future database could become an untracked second truth system, leak write authority, lose snapshot provenance or expose service_role secrets to browser/frontend contexts. | V1.22 adds 20.15-20.20 plus DBR15-DBR20 and GNG34 as a white non-blocking DB/tooling sidechain. Lean/YAML remain authoritative and active Lean/content cursor is unchanged.                                                                              |
| SCF54 | G        | closed-by-tooling-phase     | 20.21                   | V1.23          | 2026-05-10T15:20:00+02:00 | Generated PDFs needed a larger typography profile for review readability                                                                                                            | V1.22 used a 10pt document class for full/context PDFs and many explicit scriptsize/footnotesize table fragments, which made large review packets dense even after section-pagebreak and explanation improvements.                                                                      | Reviewers may miss status/provenance details in dense tables; readability pressure could otherwise lead to manual PDF edits or inconsistent per-table hacks.                                                         | V1.23 applies a one-step font-size increase at generator level: documentclass 11pt, TeX size-command bump in tables, and graph label-size bump where generated by the tool.                                                                              |
| SCF55 | G        | closed-by-planning-phase    | 20.22-20.26             | V1.24          | 2026-05-10T13:45:00+02:00 | Existing Supabase phases existed but were too broad after live project access became available                                                                                      | V1.23 already had 20.15-20.20 and DBR15-DBR20 for Supabase/Postgres architecture, but after live connector discovery the plan needed concrete activation steps for the actual project aiekahdewadrejrrdajn before any migration/import write.                                           | Without an activation split, a future DB write could blur schema design, import execution, RLS verification and web-frontend handoff into one broad DB phase, weakening auditability and no-Lean-change discipline.  | V1.24 keeps 20.15-20.20 as architecture contracts and adds 20.22-20.26 as concrete live-project activation phases, with GNG36 requiring explicit authorization and snapshot/import evidence before writes.                                               |

| ID    | Priority | Issue status                   | Addressing phase                     | Change version | Change timestamp          | Finding                                                                                                                                                                                     | Static observation                                                                                                                                                                       | Risk                                                                                                                                                                                                      | Refactoring consequence                                                                                                                                             |
|-------|----------|--------------------------------|--------------------------------------|----------------|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SCF56 | G        | closed-by-planning-phase       | 1.4.9;<br>13.2.1;<br>13.6.1;<br>18.5 | V1.25          | 2026-05-11T08:40:00+02:00 | Quaternion/geometric-algebra material needed reference-gate routing before it could influence CNNA planning.                                                                                | Horn 0709.2238v1 contains useful Hamilton/Pauli/Clifford/duality/biquaternion target information, but using it directly would blur CNNA-derived-only provenance and sign/unit semantics. | Without explicit gates, external Pauli/Clifford/Dirac or biquaternion structures could silently become inputs, set orientation or scalar layers, or patch later Pillar-B physics from established theory. | V1.25 adds GA0-GA6 and comparison phases; GNG37 forbids generator/handoff rights and keeps all material as target/scratchpad context only.                          |
| SCF57 | G        | closed-by-V1.26-tooling-schema | 20.27                                | V1.26          | 2026-05-11T09:25:00+02:00 | Phase/object status could be misread as context/type identity; tool-only, database, generated-artifact, governance and reference-gate objects needed explicit separation from Lean objects. | Earlier generated phase/object tables showed status and links but did not render an explicit class field on all phase/object logic surfaces.                                             | Category error: green generated or reference objects could be mistaken for Lean-derived objects; red/yellow Lean phases could be conflated with non-Lean tooling phases.                                  | Add Context class taxonomy and mandatory field, render in phase/object/proof/scratchpad/module-manifest tables, and enforce status/context orthogonality via GNG38. |

5 Global no-go guardrails

**What this section shows.** This table contains global rules that every phase inherits. The data comes from the Master YAML, not from Lean. It is shown because these rules constrain how new phases, refactors, generated documents and Lean implementation prompts may proceed.

**Global no-go guardrail rule.** This table is sourced from the Master YAML guardrail list. The rules below are global repository/workflow invariants, not phase-local suggestions. Every phase scratchpad inherits them through the `global_no_go_inheritance` field. Phase-local no-go lists are only stricter addenda; they may not weaken, omit, or scope away this table.

| ID    | Rule                                                                                                                                  | Scope                                                                                                 | Enforcement                                                                                                                                                                                                                                                                                                                                          |
|-------|---------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GNG01 | no @[simp] attributes in the operational path                                                                                         | Global operational Lean code path                                                                     | Rejected in implementation manifest, code review, and closeout unless the code is explicitly non-operational and the exception is recorded.                                                                                                                                                                                                          |
| GNG02 | no noncomputable in the operational path                                                                                              | Global operational Lean code path                                                                     | Operational definitions must remain computable; mirror/non-operational layers must be marked and isolated.                                                                                                                                                                                                                                           |
| GNG03 | no classical helper unless isolated in allowed mirror/non-operational layer                                                           | Global operational/mirror boundary                                                                    | Any classical use must be outside the operational path and documented as mirror/non-operational.                                                                                                                                                                                                                                                     |
| GNG04 | no Matrix.inv or external inverse oracle in operational derivations                                                                   | Global inverse/elimination derivations                                                                | Use explicit proof-carrying inverse candidates and two-sided inverse proofs; external inverse APIs are forbidden as operational sources.                                                                                                                                                                                                             |
| GNG05 | no free formula without proof-carrying entry structure                                                                                | Global formula/code-object introduction                                                               | Every formula exposed to consumers must be backed by a source object, entry structure, definition, proof target, and verification/dossier record.                                                                                                                                                                                                    |
| GNG06 | no consumer-side patch when the missing structure belongs earlier                                                                     | Global dependency/backjump discipline                                                                 | Missing structure must be introduced at its natural source layer; consumer/gate patches are blocked.                                                                                                                                                                                                                                                 |
| GNG07 | no premature obstruction before a serious positive construction attempt                                                               | Global positive-path discipline                                                                       | Obstructions require a recorded positive attempt and a localized mathematical failure reason.                                                                                                                                                                                                                                                        |
| GNG08 | no phase-semantic public API names                                                                                                    | Global public API and module-surface naming                                                           | SM/AR/phase-semantic names may remain legacy/internal but cannot be public-final neutral API.                                                                                                                                                                                                                                                        |
| GNG09 | no fragile rewrite chain when a structural constructor/projection proof is available                                                  | Global proof-tactic strategy                                                                          | Prefer constructors, projections, and explicit structural lemmas; fragile rewrite chains must be justified as local and harmless.                                                                                                                                                                                                                    |
| GNG10 | do not delete legacy status enums during quarantine                                                                                   | Global legacy quarantine workflow                                                                     | Legacy status enums may be moved/quarantined/wrapped, not deleted during the quarantine phase.                                                                                                                                                                                                                                                       |
| GNG11 | do not let Phase 3+ import Legacy.StatusGates                                                                                         | Global import firewall for post-neutral phases                                                        | Phase 3+ visibility checks must reject Legacy.StatusGates imports.                                                                                                                                                                                                                                                                                   |
| GNG12 | do not treat old TeX/PDF files as maintained roadmap sources                                                                          | Global planning/source-of-truth policy                                                                | YAML master is authoritative; old TeX/PDF files are historical/generated views only.                                                                                                                                                                                                                                                                 |
| GNG13 | no string-like or physical analogy as CNNA-generative input                                                                           | All interpretive, arithmetic, Schur/DtN, and handoff phases.                                          | Analogies may be comparison/diagnostic notes only; any formula, object, spectrum, or handoff must have a derived code/proof route.                                                                                                                                                                                                                   |
| GNG14 | no horizontal/vertical Schur-duality or string/subsystem analogy as input to earlier generators, Schur, arithmetic, or CD definitions | all Pillar-A bridge, Schur, arithmetic, CD, and generator phases                                      | the duality may only be a later theorem/diagnostic target after S05/O05/TM0/CD7/BR06/BR07 are closed; earlier phases may export data to it but never consume its conclusion                                                                                                                                                                          |
| GNG15 | no heuristic angle/lattice construction as generator or branching definition                                                          | Global generator, substrate, lattice-test, and arithmetic comparison workflows                        | Any Eisenstein/Gauss spiral or angle profile must be a consumer-only test/comparison target. The code-defined branching API is authoritative; angle drawings, CM targets, and j values may not define b, carriers, parents, or generator semantics.                                                                                                  |
| GNG16 | no special-case-only test matrix as evidence for a general computable path                                                            | All computation, arithmetic, lattice, generator, smoke-test, and refactor-regression workflows        | Eisenstein/Gauss or other sentinel rows may be included only as special comparison rows. Generic finite rows over the code-defined API must exist, or the phase remains unclosed/blocked.                                                                                                                                                            |
| GNG17 | no Heegner/class-number-one membership as closed noOuter evidence                                                                     | All number-theory, CM, lattice, regime, test-matrix, AQFT/unitarity, and comparison workflows         | A row with h(D)=1, a Heegner label, or an integer j target remains number-theoretic/comparison data until its noOuter/HasOuter regime is derived from Pillar-A source objects. Eisenstein/Gauss may be tested as noOuter-root sentinels; other Heegner targets default to HasOuter/complement-projection or comparison rows unless proven otherwise. |
| GNG18 | no replacement of ExecComplex by analytic Complex, Cayley-Dickson C-surface, or unproven exact quadratic scalar layer                 | global operational scalar path, arithmetic, lattice/CM, Cayley-Dickson bridge, and test-matrix phases | ExecComplex remains QxQ operational floor. O09 is required for later quadratic coordinates but only as a schema; concrete instances require GNG19/O10/BR14. CD-derived C may only be consumed after CD9/10.4.3 proves noncircular provenance. General Complex/Real stays mirror-only.                                                                |
| GNG19 | no free sqrt(D), no exact quadratic instance without proof-carrying D-source                                                          | all scalar, arithmetic, CM/lattice, number-theory, test-matrix, and Cayley-Dickson bridge phases      | O09 may define only a parameterized schema. Any concrete exact quadratic row must consume O10/BR14 with a D sourced from O05/O06 or an equivalent operational discriminant ledger. Analytic Complex/Real, AdjoinRoot field structures, or CD C-surfaces may not supply the early D or theta.                                                         |
| GNG20 | no artificial phase bottleneck or phase-title/object mismatch                                                                         | global phase DAG, object register, module manifest, and implementation scratchpads                    | Each object must be placed behind only the prerequisites used by its proof target. In particular, SP0/SP1/P00-P06/TM0-TM2 may not wait on modular forms, j, q-expansions, Hilbert class polynomials, theta or L-functions unless a specific bridge theorem explicitly requires that dependency.                                                      |

| ID    | Rule                                                                                                                                             | Scope                                                                                                                                                                               | Enforcement                                                                                                                                                                                                                                                                                                                                                                                                           |
|-------|--------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GNG21 | no unexplained empty Linked-objects cell and no umbrella aggregation as direct object ownership                                                  | global phase table, object register, scratchpads, module manifest, generated views                                                                                                  | Every phase must declare direct, scope_only, no_direct_object, or moved. Empty direct object sets require an explicit non-direct policy. Child object scope may be shown for readability but cannot change object Phase ownership.                                                                                                                                                                                    |
| GNG22 | no dynamics, physics, stochasticity, geometry, arithmetic, operator algebra, environment, or unitarity as ontic primitive beyond subsystem-being | global CNNA ontology, object register, phase DAG, scratchpads, proof dossiers, consumer bridges, external-comparison sections                                                       | Every such structure must cite a derived cut/regime/complement/Schur-DtN/source-object chain. If a phase needs one of these before the chain exists, it must backjump to the natural generating layer rather than postulate or patch the consumer.                                                                                                                                                                    |
| GNG23 | no 100-percent truth declaration and no bypass of discipline-specific expert review                                                              | All CNNA documentation, generated tables/PDFs/graphs/exports, phase status claims, Lean-code interpretation, object proof dossiers, and established-theory/reference markings       | The checked Lean code is the primary truth system, but even a green build only checks formal consistency of chosen declarations. Semantic correctness, modeling adequacy, theory attachments, and generated interpretations remain reviewable. Every relevant claim must remain open to specialized expert review; generated artifacts are secondary.                                                                 |
| GNG24 | no ignored missing blue/reference-theory marking                                                                                                 | All references to established mathematics/physics/computer-science background, local mathlib/formalization context, and large end-theory comparison horizons                        | If a claim, object, phase, module, or documentation passage touches established theory, the tool must decide whether it needs blue/reference marking. Missing markings are audit debt. Blue marks comparison/reference/review context only and never promotes established theory to a CNNA generator.                                                                                                                 |
| GNG25 | no tool-interface metaphor as formal CNNA theorem or ontic input                                                                                 | Documentation, database views, context slices, phase closeouts, and reflective tool architecture notes.                                                                             | The bright/dark/interface analogy may guide review and visibility obligations only. It must not be cited as a proved CNNA statement, a mathematical generator, or a reason to bypass Lean-primary proof and discipline-specific expert review.                                                                                                                                                                        |
| GNG26 | no semantic module consolidation without compatibility facade, natural-layer placement, and regression evidence                                  | All Lean refactor/merge phases, module manifest, reuse ledger, import graph, declaration consumption map, object proof dossiers, and public API/firewall phases                     | A merge/refactor may proceed only after LEG36 classifies the candidate, preserves old import paths or supplies an explicit migration facade, records import/declaration/consumer deltas, and obtains local full-build evidence. Proof-stage chains must not be merged by naming similarity or line-count pressure.                                                                                                    |
| GNG27 | no generated PDF/TeX/LaTeX build products or historical reports as active root sources                                                           | Repository root, generated full-document outputs, context-documentation outputs, release packaging, README/toolchain commands, and archive/report policy                            | The project root must remain source-oriented: README.md may stay in root; historical Markdown reports belong in archive/reports/; generated PDF, TeX, aux, log, out, toc, fls and fdb_latexmk files are disposable and must not be treated as authoritative or retained as active root files. Regenerate them from YAML/tables/scripts when needed.                                                                   |
| GNG28 | do not remove package-root Lean/Lake project-control files during cleanup or packaging                                                           | Package root, release packaging, root cleanup workflow, local build workflow, README/manual commands, future CI/database packaging                                                  | Cleanup may remove disposable generated documentation artifacts and archive historical reports, but packaging must preserve package-root CNNA.lean, lakefile.lean, lake-manifest.json, and lean-toolchain unless an explicit future build-entry phase replaces them with a proven alternative.                                                                                                                        |
| GNG29 | no duplicate active README and no hidden license/credit surface                                                                                  | Package root, Repository root, generated full/context PDFs, release packaging, README/manual commands, license notice table, and future CI/database packaging                       | The maintained README.md and LICENSE must live in the package root. Subdirectories must not carry additional active README.md files unless a future phase classifies them as generated/raw-export artifacts with explicit non-authoritative status. Generated PDFs must expose the Editor and Assistant credits from metadata.                                                                                        |
| GNG30 | generated PDF section-pagebreak invariant                                                                                                        | Full documentation generator, context documentation generator, review PDFs, future documentation layout profiles, and generated-secondary review packets                            | Top-level sections in generated PDFs must start on new pages automatically. The invariant is implemented in the generators, not by manually editing disposable TeX/PDF outputs. Layout changes must not change Lean code, Master-YAML truth semantics, or context-matching logic.                                                                                                                                     |
| GNG31 | no white direct-Lean derivation phases and no release without derived-only object evidence                                                       | Phase table, implementation scratchpad, pre-implementation checks, object register, proof dossiers, active cursor selection, generated PDFs/TSVs, future database/status dashboards | If a phase_type is derivation and the phase is not green, yellow, or orange, it must be red. A red derivation phase may become yellow or orange only after a pre-implementation release check references the required already-derived Lean objects/proof dossiers. White is reserved for refactor/tool/infrastructure/documentation/comparison work that does not itself require direct Lean-code derivation release. |
| GNG32 | main phase table is the release surface; module-change manifest is appendix-only                                                                 | Full documentation, context documentation, phase status release workflow, module-change/refactor audits, implementation scratchpads, README/manual use                              | Do not read the module-change manifest as a second phase table. It may only record concrete module/API/import-surface change contracts. Phase release status, dependencies and derived-only evidence belong to the main phase table, object register and proof dossiers. Static explanatory prose must stay generator-owned; table rows remain dynamic.                                                               |
| GNG33 | no new substantive Lean code before full IST intake, neutral naming/refactor, post-scan and release proof                                        | All future Lean implementation prompts, 1.1.1.2 blue-object correction, Phase 1.x neutralization, public API/firewall phases, and later red locked derivation phases                | Before any new substantive Lean content phase becomes yellow, the plan must reference closed LEG37-LEG41 or spawn a red blocker at the natural source layer. Refactoring/tooling may proceed only inside the pre-code readiness chain and must preserve old imports through facades until build-proven.                                                                                                               |
| GNG34 | Supabase/Postgres mirror is public read-only and never a CNNA truth source                                                                       | Supabase/Postgres schemas, public api.* views, web frontend, importer/admin paths, future Edge Functions, reviewer annotations, DB snapshots and cnna-project.net visualization.    | No Supabase row may release a phase or replace Lean/YAML provenance. Public/anon access is SELECT-only on api.* views. No public writes. No browser service_role key. No DB update without snapshot_id, source hashes and import report. Every public row must be traceable to a Lean/YAML snapshot.                                                                                                                  |

| ID    | Rule                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Scope                                                                                                                                                                                                                  | Enforcement                                                                                                                                                                                                                                                                                                    |
|-------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| GNG35 | generated PDF typography changes must be generator-level and semantic-neutral                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Full documentation generator, context documentation generator, table generator, graph-label generation, generated PDF review packets and future documentation layout profiles                                          | Font-size changes must be applied in generators/source tables, not by manual PDF edits. They must not alter Lean code, YAML row semantics, context filtering, phase status logic, proof status, or public database/export semantics.                                                                           |
| GNG36 | no live Supabase write without explicit authorization, snapshot provenance and no-Lean-change boundary                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            | Supabase migrations/imports, ChatGPT direct DB connector use, local importer scripts, future cnna-project.net publication layer, release packaging and DB reports                                                      | Any live apply __migration/execute_sql write must be explicitly authorized by the user for the current step, must write only Supabase schema/data, must not edit Lean files, must produce snapshot_id/source-hash/import-report evidence, and must preserve public read-only/no-service-role-in-browser rules. |
| GNG37 | Quaternion/geometric-algebra references are target gates only                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Horn 0709.2238v1, Hamilton quaternion relations, Pauli matrices, Clifford/geometric algebra, biquaternions, spacetime algebra, conformal GA, mathlib Quaternion/CliffordAlgebra APIs and future GA comparison modules. | These references may define comparison profiles, sign audits, scratchpad notes and expert-review targets only. They cannot generate CNNA objects, set scalar layers, choose orientations/dimensions, release phases, create handoff data or shortcut derived-only proofs.                                      |
| GNG38 | Status/context orthogonality and Lean-facing subclass separation. Phase status and Object status encode release/proof-state only; Context class encodes type/class membership. No ToolInfrastructureObject, DatabaseMirrorObject, GeneratedArtifactObject, DocumentationObject, GovernancePolicyObject or ReferenceGateObject may be consumed as a LeanSourceObject/LeanTargetObject or as derived mathematical data because it is green, linked or documented. LeanRefactorObject, LeanHandoffContractObject and LeanGovernanceObject are Lean-facing control classes, not automatically mathematical CNNA data. | All phase, object, proof-dossier, scratchpad, generated export, DB mirror and implementation-prompt surfaces.                                                                                                          | All new phase/object rows must declare Context class from the taxonomy. Generated tables render Context class beside status. Future DB schema must mirror the field. Any phase release must cite LeanSourceObject/LeanTargetObject evidence, not merely a green tool/reference/governance object.              |

## 6 Global ontic postulates

**What this section shows.** This section records the global ontic/provenance postulates used by the planning layer. It is intentionally separated from Lean axioms: these statements guide the roadmap and review discipline, but do not become Lean theorems by appearing here.

**Global postulate rule.** The postulate below is a global ontology/provenance constraint, not a Lean axiom and not a physical input. It fixes the permitted primitive emergence trigger for the roadmap: subsystem-being inside the formal IDEAL\_infty provenance whole. Everything else must be derived or explicitly marked comparison-only.

| ID    | Postulate                       | Precise formulation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     | Allowed primitive                                                                   | Derived-only consequences                                                                                                                                                                                 | Forbidden primitive imports                                                                                                                                                              | Enforcement                                                                                                                     |
|-------|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------|
| POST1 | CNNA ontic subsystem-minimality | The only primitive ontic emergence trigger is subsystem-being: the selection of a finite or local subsystem, cut, or approximant inside the formal IDEAL_infty provenance whole. IDEAL_infty is the formal relational/provenance background, not a physical dynamics input. All dynamics, spectra, operator algebra, arithmetic, geometry, stochasticity, openness, unitarity claims and physical interpretation must be derived from the subsystem/complement relation and its Schur/DtN consequences. | Subsystem/cut/approximant selection within the formal IDEAL_infty provenance whole. | boundary;<br>inside/outside distinction;<br>complement families;<br>regime noOuter/HasOuter;<br>Schur/DtN effective operator;<br>spectra;<br>algebra;<br>arithmetic;<br>geometry;<br>dynamics;<br>physics | dynamics;<br>time evolution;<br>stochasticity/noise;<br>environment;<br>geometry/lattice;<br>arithmetic/discriminant;<br>operator algebra;<br>AQFT/physics;<br>Cayley-Dickson structures | Implemented through LEG35, GNG22, phase 1.1.1.1.0.16, object proof dossiers, scratchpad inheritance, and consumer-phase audits. |

## 7 Phase-object-link policy

**What this section shows.** This policy explains how phases and objects are linked in the generated documentation. The table is shown before the object and phase registers so the reader knows when a linked object is directly owned by a phase and when it is only part of an umbrella scope.

**Phase-object-link policy rule.** Direct object ownership is defined only by exact equality `object.Phase == phase.Phase`. Umbrella phases may display child-object scope for navigation, but child scope does not transfer ownership. A generated phase row may therefore never show an unexplained blank **Linked objects** cell: it must be rendered as direct links, scope-only child summary, no-direct-object explanation, or moved placeholder.

| Kind             | Meaning                                                                                                                           | Required evidence                                                                                      | Rendering rule                                                                                                                     |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|
| direct           | Phase directly owns registered object(s).                                                                                         | At least one object has Phase exactly equal to the phase id.                                           | Render direct object hyperlinks. Do not aggregate child phase objects as direct ownership.                                         |
| scope_only       | Phase is an umbrella/routing/scope phase; objects are owned by child phases.                                                      | No direct objects and at least one descendant phase has direct object(s).                              | Render scope-only plus a bounded child-object summary.                                                                             |
| no_direct_object | Phase intentionally has no direct object, e.g. baseline, audit, closeout, generator/view infrastructure without object ownership. | No direct objects and no descendant-object ownership needed for the phase semantics, plus explanation. | Render no direct object with reason; never leave cell blank.                                                                       |
| moved            | Historical placeholder or routing note whose active objects are owned elsewhere.                                                  | Main goal/definition/proof goal identifies the destination phase or ownership move.                    | Render moved placeholder and reason/destination; no direct object links unless the placeholder also owns an explicit audit object. |

8 Phase/object context-class taxonomy

**What this section shows.** This section adds an object-oriented class layer above phases and objects. Status colors say release/proof state; context class says what kind of row it is: Lean, tool, database mirror, generated artifact, documentation, governance, or external reference gate. It is shown before object and phase registers to prevent tool-only or reference-only rows from being read as Lean objects.

**Context-class taxonomy rule.** This table is an orthogonal class/type layer over the phase and object registers. It applies an object-oriented reading to the planning schema: **Context class** says what kind of entity a row is, while status colors say only release/proof state. A green generated, database, documentation, governance or reference row is therefore not a green Lean object. Conversely, a red Lean derivation phase remains a Lean derivation phase, but blocked by missing derived-only evidence.

| Class                     | Applies to | Parent class                           | Meaning                                                                                                                                                                                                        | Truth role                                                                                                                                                      | Allowed consumers                                                                                        |
|---------------------------|------------|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------|
| PhaseBase                 | phase      | root                                   | Abstract superclass for all roadmap phases.                                                                                                                                                                    | No truth role by itself; subclasses determine whether the phase may touch Lean, tooling, documentation, DB or reference material.                               | Only used by generated validators/tables.                                                                |
| LeanDerivationPhase       | phase      | PhaseBase/LeanPhase                    | Direct Lean mathematical/content derivation phase.                                                                                                                                                             | May eventually create or close checked Lean objects, but only after derived-only release evidence.                                                              | Lean implementation prompt, object proof dossier, downstream phases after closure.                       |
| LeanRefactorPhase         | phase      | PhaseBase/LeanPhase                    | Lean code/API/name/import-surface refactor phase without new mathematical content by itself.                                                                                                                   | Preserves/reorganizes checked code; does not prove new mathematics unless separately registered.                                                                | Build/refactor workflow and later Lean phases after regression checks.                                   |
| LeanGovernancePhase       | phase      | PhaseBase/GovernancePhase              | Policy/release/import/consumer-governance phase that controls Lean work but is not itself a Lean theorem.                                                                                                      | Planning authority only; must not be cited as mathematical proof.                                                                                               | Implementation prompts and generated validators.                                                         |
| ReferenceGatePhase        | phase      | PhaseBase/ComparisonPhase              | External established-theory or side-theory comparison/target gate.                                                                                                                                             | Comparison/reference only; never CNNA generator or input.                                                                                                       | Scratchpads, review gates and later consistency checks after CNNA-derived data exists.                   |
| ToolInfrastructurePhase   | phase      | PhaseBase/ToolPhase                    | Python/YAML/generator/schema/tooling phase.                                                                                                                                                                    | Generated-secondary tooling; cannot release Lean mathematical claims.                                                                                           | Documentation tool, exporters, future DB mirror.                                                         |
| DatabaseMirrorPhase       | phase      | PhaseBase/ToolPhase                    | Supabase/Postgres/public-read mirror or frontend publication phase.                                                                                                                                            | Read/query/publication mirror only; not a truth source.                                                                                                         | Public API/frontend/review tooling after snapshot/checksum rules.                                        |
| GeneratedArtifactPhase    | phase      | PhaseBase/ToolPhase                    | PDF/TSV/DOT/README/package generated-output phase.                                                                                                                                                             | Rendering/navigation/release packaging only.                                                                                                                    | Readers, documentation exports, release packages.                                                        |
| DocumentationPhase        | phase      | PhaseBase/DocumentationPhase           | Human-readable documentation, review matrix, no-infallibility statement, or manual workflow phase.                                                                                                             | Interpretive documentation; expert review required.                                                                                                             | Reviewers and future tool/database views.                                                                |
| BaselinePhase             | phase      | PhaseBase                              | Frozen baseline or package state phase.                                                                                                                                                                        | Records baseline identity only.                                                                                                                                 | Regression comparison and package history.                                                               |
| ObjectBase                | object     | root                                   | Abstract superclass for all registered objects/quantities/control artifacts.                                                                                                                                   | No truth role by itself; subclasses determine whether the row is Lean, target, tool, DB, reference, generated or governance.                                    | Object register/proofbook validators.                                                                    |
| LeanSourceObject          | object     | ObjectBase/LeanObject                  | Object has an existing Lean source/seed or canonical Lean module site.                                                                                                                                         | Potential checked-code object; exact semantic status still governed by Object status and proof dossier.                                                         | Lean phases subject to import/consumer discipline.                                                       |
| LeanTargetObject          | object     | ObjectBase/LeanObject                  | Planned or future Lean object/candidate, not a checked final object yet.                                                                                                                                       | Target only until implemented and proof-checked.                                                                                                                | Planning/proof rehearsal; not public-final.                                                              |
| LeanRefactorObject        | object     | ObjectBase/LeanObject/RefactorObject   | Lean-facing refactor, notation, facade, quarantine or import-surface object. It may point to Lean modules, but its semantic role is reorganization/compatibility rather than new mathematics.                  | Code-shape object only; preserves or exposes checked code and must not be cited as a new derived mathematical theorem.                                          | Lean refactor phases, regression checks and downstream phases after build-compatible migration evidence. |
| LeanHandoffContractObject | object     | ObjectBase/LeanObject/ContractObject   | Lean-facing handoff/input/output contract object. It controls access between pillars or phase layers and may have a Lean target module, but it is not itself the mathematical data transported by the handoff. | Interface/consumer-rights object; downstream phases may consume only the separately registered LeanSourceObject or LeanTargetObject data named by the contract. | Handoff validators, pillar-boundary phases and later Lean phases subject to access rights.               |
| LeanGovernanceObject      | object     | ObjectBase/LeanObject/GovernanceObject | Lean-facing policy/audit object whose natural representation may be a Lean module or proof-carrying record, while the content remains governance rather than mathematical CNNA data.                           | Checked governance/audit boundary if implemented; never a substitute for a derived mathematical object.                                                         | Static audits, import/consumer discipline, release gates and implementation prompts.                     |
| GovernancePolicyObject    | object     | ObjectBase/GovernanceObject            | Policy, ledger, guardrail, release, import or consumer-control object.                                                                                                                                         | Controls work; does not constitute mathematical CNNA data.                                                                                                      | Implementation prompts, validators and review checklists.                                                |
| ReferenceGateObject       | object     | ObjectBase/ComparisonObject            | External theory/reference/comparison/target-gate object.                                                                                                                                                       | Comparison-only; never ontic or generative CNNA input.                                                                                                          | Scratchpads and later consistency gates after CNNA-derived objects exist.                                |

| Class                    | Applies to | Parent class                   | Meaning                                                            | Truth role                                                               | Allowed consumers                                |
|--------------------------|------------|--------------------------------|--------------------------------------------------------------------|--------------------------------------------------------------------------|--------------------------------------------------|
| ToolInfrastructureObject | object     | ObjectBase/ToolObject          | YAML/schema/script/export/tooling object.                          | Generated-secondary/tooling;<br>cannot be mistaken for Lean object.      | Documentation tool and future database importer. |
| DatabaseMirrorObject     | object     | ObjectBase/ToolObject          | Supabase/Postgres/frontend/read-only mirror object.                | Publication/query mirror only;<br>never Lean/YAML truth replacement.     | Public read-only API/frontend/review tooling.    |
| GeneratedArtifactObject  | object     | ObjectBase/ToolObject          | PDF/TSV/DOT/README/package output or generated rendering contract. | Rendering/navigation artifact;<br>semantically reviewable and secondary. | Readers and release packages.                    |
| DocumentationObject      | object     | ObjectBase/DocumentationObject | Documentation/review statement or expert-review object.            | Interpretive;<br>expert review remains required.                         | Reviewers and documentation slices.              |

9    Object/phase significance and documentation-depth tiers

**What this section shows.**    This section adds a second orthogonal classification axis: not what a row is, but how fundamental it is and how much proof/documentation burden it carries. It prevents fundamental generator or handoff objects from being under-documented while keeping trivial, auxiliary, or mention-only rows from bloating the proofbook.

**Object/phase significance-tier rule.**    This table is a second orthogonal classification axis. **Context class** says what a row is; **Significance tier / Phase documentation tier** says how deep the proof/documentation burden is. It is deliberately independent of status and class: a reference gate may be high-significance, and a Lean-facing helper may be auxiliary. Trivial rows stay visible without bloating the proofbook; fundamental rows must receive full dossiers before public-final promotion or downstream consumption.

| Tier | Name         | Applies to    | Meaning                                                                                                                                          | Documentation requirement                                                                                                                                                                               | Promotion / demotion rule                                                                                                                                 |
|------|--------------|---------------|--------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------|
| F0   | fundamental  | object, phase | Ontic, generator, handoff, invariant, or root-contract level. Failure changes the meaning of the derived-only architecture or a pillar boundary. | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty. | May not be promoted by generated prose or status color. Must cite checked Lean code or an explicit governance contract and must remain expert-reviewable. |
| F1   | core         | object, phase | Core derived object, API seam, comparison gate, or proof route that many later phases depend on, but not itself an ontic root.                   | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.          | May be promoted to F0 only if it becomes a pillar-boundary or generator-level contract; may be demoted only after no downstream dependency relies on it.  |
| F2   | standard     | object, phase | Ordinary derived object, target object, or reference/comparison profile with local but real mathematical or planning relevance.                  | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                           | Promote to F1 if several later phases consume it, if it crosses a handoff/API boundary, or if an expert-review risk is discovered.                        |
| F3   | auxiliary    | object, phase | Support, migration, tooling, generated artifact, ledger, or narrow refactor helper. Important for auditability but not a mathematical generator. | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                               | Promote to F2/F1 only if it starts carrying semantic proof obligations or becomes a required release gate.                                                |
| F4   | mention-only | object, phase | Trivial, navigational, future-side, purely illustrative, or low-risk reference row. It should be visible but not exhaustively documented.        | Mention and pointer only: name, context class, status, and reason for non-consumption. No full proof dossier unless promoted.                                                                           | Automatically promote if it becomes a dependency, is consumed by Lean code, controls access/release, or carries a reference-theory risk.                  |

10 TomS thread source cross-check

**What this section shows.** This section tracks external review prompts and mathematical warnings from TomS-related discussion material. It is comparison and correction context only. It is shown to keep established-theory cautions visible without importing them as CNNA generators.

**Source-integration rule.** This is an external-reference audit only. TomS thread material and public mathematical references may define comparison targets, warning signs, and proof obligations, but they do not supply CNNA-generative data. Every accepted action below is therefore routed through existing or newly added derived-only phases and object records.

| ID      | Topic                                                   | Thread evidence                                                                                                                                  | External check                                                                                                                                                                       | Plan disposition                                                                                   | CNNA action                                                                                                                                   | Phase/Object                               | Risk / uncertainty                                                                                                               |
|---------|---------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------|
| TOMS-01 | Prime generation vs irreducible/prime distinction       | #8-#10 and #48: Schur levels, Eisenstein/Gauss norm heuristics, TomS correction that irreducible need not be prime                               | Algebraically standard: UFD/PID/class-number gates are required before irreducible=prime can be claimed                                                                              | Already broadly covered by NumberTheory phases but wording must stay strict.                       | Keep Heegner/PID/UFD indicator after class number; never claim prime generation from norm irreducibility without class-number/UFD proof.      | 6.2, 6.3 / N09-N13                         | The v3 script observations remain empirical/heuristic until operational recurrence, norm form, and class group gates are proved. |
| TOMS-02 | Quadratic orders and lattice types                      | #9-#11: imaginary-quadratic integer rings have two order-shapes by d mod 4; elliptic functions exist on arbitrary non-collinear complex lattices | Established CM theory: quadratic orders/lattices are restrictive subfamily of all elliptic lattices                                                                                  | Covered by D_fund/order/lattice/tau phases; add caution to source map.                             | Do not say Schur levels generate all elliptic lattices; derive D/order/basis/tau first, then compare Gauss/Eisenstein special cases.          | 5.1-8.3 / N00-N07, L00-L07                 | Current code has special Gaussian/Eisenstein bridges but no general D_op->order pipeline.                                        |
| TOMS-03 | SL2Z/Moebius, modular functions, j                      | #13/#15/#22: SL2Z matrices act by z -> (az+b)/(cz+d), S and T generate transformations; j as invariant modular function                          | Milne/standard modular-form references support j as generator of modular-function field; thread contains minor typo-like fundamental-domain bound, so do not copy formulas unchecked | Already present but should remain after CM/tau, not before.                                        | Keep modular group action, fundamental-domain representative, q-expansion and Hilbert class polynomial as post-lattice/modular phases.        | 9, 10.3 / M00-M06                          | Need authoritative source and mathlib import check at implementation; do not treat forum formulas as formal definitions.         |
| TOMS-04 | j algebraic at CM points                                | #30: j(tau) algebraic on imaginary-quadratic tau; CM connection                                                                                  | Milne modular-function notes and CM theory support algebraicity at imaginary-quadratic points                                                                                        | Covered by CM/lattice/j phases but dependency should be explicit.                                  | Require tau upper-half-plane and CM/order provenance before j-values/class-polynomial work.                                                   | 8-10.3 / L04-L05, M05-M06                  | Exact field/class-polynomial statements require class group/ring class field layer; current plan only has placeholders.          |
| TOMS-05 | L-functions are not Riemann-zeta-first                  | #49: TomS says zeta/L-functions yes, not specifically Riemann zeta; modular forms are the bridge                                                 | Standard theory: many L-functions attach to characters/modular forms; Riemann zeta is special with trivial character                                                                 | Plan should not introduce Riemann-zeta as generator.                                               | Keep chi_D/splitting before any L-function comparison; any L-function object is derived/comparison after character/modular data.              | 6.4, 10.5 / N15, spectral-zeta side object | Avoid conflating spectral zeta, Dirichlet L-functions, and Riemann zeta.                                                         |
| TOMS-06 | Finite simple groups taxonomy                           | #43-#56: cyclic, alternating, Lie type, sporadic groups; groups as generalized prime-like objects                                                | Warwick WMI: CFSG categories are cyclic prime order, alternating, Lie type, sporadic                                                                                                 | Gap in v20: Moonshine section lacked explicit finite-simple-group taxonomy as comparison-only.     | Add MOON3/MOON4 and phase 12.4 as external comparison context only.                                                                           | 12.4 / MOON3-MOON4                         | CFSG is extremely deep; never import it into A proof path as an unchecked theorem.                                               |
| TOMS-07 | Monster is not final object; common indicator matters   | #64-#71: Monster/Moonshine; #67/#70 says Monster is only tip of iceberg, seek connecting structure and common indicator                          | Borcherds 1992 proves Conway-Norton moonshine conjectures using vertex algebras, Thompson series/Hauptmoduls, Monster simple group                                                   | v20 had Monster/McKay-Thompson placeholders; needs common-indicator/Hauptmodul bridge-test record. | Add MOON8 and phase 12.8; make Monster comparison subordinate to derived q-character/Hauptmodul tests.                                        | 12.8 / MOON8                               | Do not overfit CNNA to Monster; use it as late fingerprint test only.                                                            |
| TOMS-08 | Leech lattice/rootlessness/theta shell data             | #84/#93: Leech lattice has no roots; shell/theta coefficients expose missing first shell and 196560 minimal vectors                              | Borcherds 1985 proves Leech lattice existence/uniqueness and records no-root/Niemeier context                                                                                        | Gap in v20: no Leech-specific comparison object.                                                   | Add MOON5/MOON6 and phases 12.5-12.6.                                                                                                         | 12.5-12.6 / MOON5-MOON6                    | Thread details around root systems were corrected by Jakito/TomS; use corrected Erzeugendensystem not basis wording.             |
| TOMS-09 | VOA/chiral CFT/string-theory context                    | #64: Moonshine connection to bosonic string compactified on Leech lattice and 2D chiral CFT; #82/#85 caution about physics-from-math             | Borcherds 1992 keywords include vertex algebras, monster simple group, Thompson series, Hauptmoduls                                                                                  | Needs strict comparison/consumer boundary.                                                         | Add MOON7 and keep string theory in side-comparison phase 18.2; no VOA/string axiom import into Pillar A.                                     | 12.7, 18.2 / MOON7                         | VOA formalization is much deeper than current A path; only finite graded truncations may be computable comparison artifacts.     |
| TOMS-10 | Elliptic functions are related but not the final bridge | #82/#89: TomS did not use elliptic functions as over-arching link; Jakito notes G_{2k}, Delta, j arise from elliptic-function lattice theory     | Standard modular/elliptic-function pedagogy supports G4/G6 -> g2/g3 -> Delta -> j                                                                                                    | Already covered by modular forms and Weierstrass invariant phases.                                 | Keep elliptic-function material as necessary j-construction route, not as claimed universal CNNA endpoint.                                    | 9.1-9.2 / M02-M05                          | At implementation, distinguish analytic exact layer from finite q/truncation mirror.                                             |
| TOMS-11 | Fractal fundamental-domain imagery is low priority      | #22/#24: fractal image language for iterated fundamental domains is explicitly uncertain/irrelevant in thread                                    | No primary formal target needed for current CNNA plan                                                                                                                                | No action in near path.                                                                            | Do not create a CNNA object for fractality; if ever needed, classify as visualization or tessellation comparison after modular action exists. | 10.3 only if needed                        | Avoid spending proof effort on metaphorical/visual claims.                                                                       |
| TOMS-12 | Physics-from-math caution                               | #37/#85: TomS objects that physics is not obtained by pure mathematics alone; thread is not a CNNA ontological source                            | Methodological warning aligns with comparison-only and handoff discipline                                                                                                            | Supports existing access policy.                                                                   | Keep established physics/math theories as references and tests, never as ontic/generative inputs.                                             | access_policy; 18.* comparisons            | Empirical/physical claims remain speculative unless reconstructed from CNNA and compared to experiment.                          |

| ID         | Topic                                                                     | Thread evidence                                                                                                                                                                                                           | External check                                                                                                                                                                                                | Plan disposition                                                                                                                  | CNNA action                                                                                                                                                                                                                                                               | Phase/Object                                             | Risk / uncertainty                                                                                                                                                                                                  |

| TOMS-13    | Heuristic b-ary tree construction of Eisenstein/Gauss lattice profiles    | post #97: b-ary address construction; b>=2 heuristic; Eisenstein angle 120 degrees and closure of 0-path at level 3; Gauss angle 90 degrees and closure at level 4; hierarchical overlays versus spiral angle dependence. | The thread entry is heuristic and self-authored, not a theorem source. Established CM/j special targets should be verified from formal references during M05/M08; forum data may define tests but not proofs. | Add green boundary lock 1.1.1.1.0.9 and future phases 8.5-8.7 for static/dynamic test matrices and closeout.                      | Use code-defined branching b. Test rows must cover angle, rational cosine, finite address collisions/closure, CM point target, discriminant target, and j target over selected L_max values. Keep complex coordinates/tau/j analytic evaluation mirror-only under EXEC-2. | 1.1.1.1.0.9; 8.5-8.7 / LEG28, L09, L10, M08, BR10        | The geometric embedding is not yet derived from the generator; it may fail or remain comparison-only. Dynamic branching and general D require later source objects and cannot be assumed from b=2 drawings.         |
| TOMS14     | Post #97 as early general test source, not special-case tunnel            | Post #97 motivates Eisenstein/Gauss angle/closure tests from b-ary tree drawings.                                                                                                                                         | The source is heuristic and special-case oriented; it does not define the code branching object or a complete general test suite.                                                                             | Use as sentinel rows inside O07/L09/L10, not as the complete test matrix.                                                         | Add LEG29/O07 and GNG16; update Phase 8.5/8.6 to require generic coverage before sentinel interpretation.                                                                                                                                                                 | 1.1.1.1.0.10, 4.0.1, O07, L09/L10/M08/BR10               | If generic rows are too weak, sentinels may create false confidence. Coverage must be reviewed when real code starts.                                                                                               |
| TOMS15     | Eisenstein/Gauss as noOuter-root sentinels, not the full Heegner story    | Post #97 gives b-ary address and angle/closure heuristics: 120 degrees with closure at L=3 for Eisenstein; 90 degrees with closure at L=4 for Gauss; the author also marks the discussion as heuristic in #99.            | Class-number-one/Heegner lists contain more than D=-3 and D=-4, so CNNA must not identify all Heegner targets with the closed/noOuter branch. Established lists are comparison targets, not CNNA derivations. | Add LEG30/O08/N18/BR11/BR12, GNG17, and phases 1.1.1.1.0.11, 4.0.2, 7.2.1.                                                        | Use regime-typed test rows: Eisenstein/Gauss are noOuter-root sentinel candidates; other Heegner/CM targets are HasOuter/complement-projection or comparison rows unless noOuter provenance is derived.                                                                   | 1.1.1.1.0.11; 4.0.2; 7.2.1 / LEG30, O08, N18, BR11, BR12 | This is a CNNA hypothesis and test classification, not yet a theorem. It may fail once concrete rows are computed; failure should trigger backjump to regime/complement source layers, not a consumer patch.        |
| HORN-GA-01 | Horn 0709.2238v1 quaternion, Pauli and geometric-algebra synthesis        | Uploaded PDF 0709.2238v1, sections on quaternions, Pauli matrices, geometric algebra and duality.                                                                                                                         | Horn presents quaternions, Pauli matrices and Hestenes geometric algebra as overlapping frameworks synthesized through duality; the paper is didactic/conceptual and not a CNNA proof source.                 | Create comparison/reference gates GA0-GA3 under 1.4.9.* and keep them outside the derived-only generator chain.                   | Record target identities and ambiguity warnings: Hamilton unit products, Pauli/Cartan sign choices, complex-i versus quaternion-i, pseudoscalar duality, pure quaternion as bivector and biquaternion multivector bookkeeping.                                            | 1.4.9; 1.4.9.1; 1.4.9.2 / GA0-GA3                        | Sign conventions, orientation choices and semantics are underdetermined by the external reference; a CNNA-derived object may fail the target or match only after a natural-origin proof supplies missing structure. |
| HORN-GA-02 | Mathlib Quaternion and CliffordAlgebra seams as future formal target APIs | Web source review of current mathlib Quaternion and CliffordAlgebra documentation plus Lean geometric-algebra formalization literature.                                                                                   | Mathlib exposes Quaternion/QuaternionAlgebra and CliffordAlgebra APIs; Wieser/Song note GA formalization through CliffordAlgebra and gaps around wedge/N-grading.                                             | Record as possible future comparison implementation seams only; no import is added before local Lean/mathlib 4.28.0 verification. | Add scratchpad expected-import warnings for 1.4.9.*, 13.2.1 and 13.6.1; route implementation through minimal target profiles if mathlib imports are too heavy or noncomputable.                                                                                           | 1.4.9.1; 1.4.9.2; 13.2.1; 13.6.1 / GA1-GA5               | Live docs may differ from the pinned project snapshot. Noncomputable or classical pressure must remain in mirror/comparison layers and never enter operational paths.                                               |
| HORN-GA-03 | Dirac, spacetime algebra and conformal GA as late target gates only       | Horn discussion of quaternionic Dirac motivation, complex quaternions, outlook toward spacetime algebra and conformal geometric algebra.                                                                                  | The material is useful for target-gate design but cannot supply Lorentz structure, Dirac equations, spacetime dimension or conformal geometry as CNNA inputs.                                                 | Add 13.6.1 and 18.5 as late comparison phases with GA5-GA6.                                                                       | Use after Pillar-B local-net/modular data and side-comparison outputs exist; compare signatures and structural compatibility, not foundations.                                                                                                                            | 13.6.1; 18.5 / GA5-GA6                                   | Potentially high heuristic pull toward established physics. Guardrail: no Dirac/STA/CGA theorem enters CNNA before derived predecessor objects exist.                                                               |

11    Secondary long-term goals

**What this section shows.**    This table contains side objectives and long-horizon tool/theory ambitions, including database and interactive-map directions.    The rows are shown because some principles apply immediately even if their technical realization remains later.    They must not displace the active Lean/content path.

**Secondary long-term goal rule.**    The goals below are secondary to Lean implementation, but not all are purely downstream.    The Vision column records motivating long-horizon interface and review ambitions without upgrading them to CNNA inputs.    When a goal is marked as immediate-principles, its epistemic/governance constraints apply now while its technical implementation may remain later.    These goals may use generated repository metadata, proof dossiers, derivation graphs, review records, context-documentation slices, and future database exports as documentation or diagnostic material, but they do not supply CNNA-generative data.    They must not displace the active Phase-1 cleanup, computable-instance traversal, or derived-only object closure.

| ID      | Goal                                                                                        | Motivation                                                                                                                                                                                                                                       | Vision                                                                                                                                                                                                                       | Raw data / tools                                                                                                                                                                            | Operational scope                                                                                                                                               | Not-before gate                                                                                                                                                                | Derived-only boundary                                                                                                                                            | Plan action                                                                                                                                                                                                                                             |
|---------|---------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SLTG-01 | Semi-automated documentation of existing Lean code inside the same planning/proofbook tool. | The Bestandscode cannot be fully normalized at once, but every module, declaration family, object, proof bridge, and consumer path can be documented with the same YAML/proof-dossier infrastructure so later interpretation is minimized.       | Existing Lean-code documentation should grow into a reviewable object universe: each missing object/quantity becomes a dossier-backed node that can be inspected by the relevant expert without reading the full repository. | repo_inventory/raw_export modules.json, import_edges.json, symbol_reference_summary.json, dependency_order, mainline forensics, object register, proof dossiers, implementation scratchpad. | Secondary workflow: document existing code and its true consumers while Phase 1.x cleans the public API. It does not authorize refactors or deletion by itself. | After Phase 1.1.1.1.4 declaration consumption classification and initial proof-dossier infrastructure are closed; deeper execution after Phase 1.1.5 import firewall is green. | Documentation may classify provenance and consumers; it may not turn graph metadata into CNNA-generative assumptions.                                            | Add Phase 19.1 and object LEG16; use the generated Lean module graph to prevent forgotten code/documentation gaps. V1.12 adds LEG36 so existing-code documentation also records semantic consolidation/no-merge candidates before new substantive code. |
| SLTG-02 | Derivation-graph geometry of the formalized theory.                                         | The repository already contains graph-theoretic data: import graph, dominators, layer decomposition, source-sink signal paths, and robust semantic mainline. These can later expose bottlenecks, weak derivation edges, and discipline clusters. | A later graph/database layer can provide semantic zoom from pillars to phases, modules, declarations, objects, proof dossiers, and theorem sites; the graph remains a diagnostic/evidence map, not a generator.              | import_edges.json, dominator analysis, layer decomposition, source-to-sink paths, module group graph, architectural core summary, mainline forensics.                                       | Secondary research/diagnostic layer only. Use it to understand theory organization and proof pressure after core derivations are stable.                        | After the neutral API, generator governance, object proof dossiers, and main operational arithmetic/DtN paths have stabilized; not before active Phase 1.x cleanup.            | Graph geometry can suggest audits and consistency checks but cannot supply mathematical axioms, stochasticity, open-system behavior, or physical interpretation. | Add Phase 19.2 and object LEG17; render/import future graph metrics such as dominators, cuts, signal-path depth, cluster boundaries, and optional Cheeger-style diagnostics as comparison metadata.                                                     |
| SLTG-03 | Formal emergence-path forensics for open-system dynamics inside the derivation network.     | Later, once Pillar A/C objects are derived, the proof/module graph may help locate where closed finite subsystem assumptions become open effective dynamics through boundary/complement/regime handoffs.                                         | When A/C open-system paths exist, graph forensics can show where regime, complement, boundary, and handoff structures make openness visible, but the dynamics must still be derived in Lean-facing CNNA objects.             | A-regime profiles, complement-family profiles, DtN/Schur handoff modules, C/OQS consumer path, source-sink paths, dominator/cut analysis, object proof dossiers.                            | Post-core analysis of the formalization topology; not a replacement for deriving open-system behavior inside CNNA.                                              | After A regime/complement path, A->C handoff, and C OQS consumer roadmaps have enough checked objects to analyze. Treat as bonus/secondary until then.                         | Emergence claims must still be proved from CNNA objects; graph forensics only localize proof paths, bottlenecks, and structural analogies.                       | Add Phase 19.3 and object LEG18; keep as black/secondary target until the relevant A/C derivations exist.                                                                                                                                               |
| SLTG-04 | Reflective comparison between CNNA object-structure and formalization-structure.            | If the formal derivation graph later exhibits structural features resembling CNNA objects - layering, boundary cuts, operators on graphs, signal flow, modular clusters - this should be studied as a meta-level observation, not as a premise.  | The tool may be read as a meta-level interface analogue: one active cursor/bright object is examined against the large Lean-code complement; this is an operational review metaphor, not a CNNA theorem.                     | discipline subgraphs for Dirichlet/DtN/Schur, prenumerical/ToC/Substrate, Topology/Algebra/CD; module clusters; graph cuts; source-sink paths; proof-dossier links.                         | Far-target meta-analysis and visualization after mathematical closure. It may produce diagnostics, figures, and research notes, not new CNNA base assumptions.  | Only after core derived objects, public API, and consumer handoffs are stable enough that graph measurements are meaningful.                                                   | Strictly comparison/diagnostic. Any apparent self-similarity between theory and formalization remains an observation unless separately formalized and proved.    | Add Phase 19.4 and object LEG19; keep outside the active implementation path.                                                                                                                                                                           |
| LT5     | Thread/full-boundary derivation-geometry and string-analogy diagnostics                     | The IdealThread/full-cut extrema may later illuminate how one-dimensional recursive routes sit inside full boundary/operator geometry and how open-system behavior emerges from complement/interface structure.                                  | Future string-analogy diagnostics may use derivation geometry as a comparison map around the thread/full-boundary extrema, only after the underlying route is derived and reviewed.                                          | IdealThread/CutSpec.full profiles; import graph; derivation graph; Schur/DtN route audit; proof dossiers; source-sink paths and dominators.                                                 | Secondary diagnostic/comparison study only, after the underlying CNNA objects are code-derived and public-final.                                                | After S07, S08, BR06, BR07, S05/S06, and the relevant arithmetic/number-theory proof dossiers are closed.                                                                      | The diagnostic may compare formalization geometry to CNNA objects but cannot feed back as a generative axiom, formula, or shortcut.                              | Keep as Phase 19.5 side-road; do not block active Phase 1 cleanup or Phase 3/4 neutralization.                                                                                                                                                          |

| ID      | Goal                                                                                       | Motivation                                                                                                                                                                                                                  | Vision                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Raw data / tools                                                                                                                                                                                                                   | Operational scope                                                                                                                                                                        | Not-before gate                                                                                                                                                           | Derived-only boundary                                                                                                                                                                                                              | Plan action                                                                                                                                                                                                                                                                                   |
|---------|--------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| SLTG-06 | Database-ready CNNA review and documentation structure                                     | A database-backed representation is likely the most effective path for querying, analyzing, visualizing, sharing, online display, interactive exploration, and discipline-separated expert review of the CNNA object world. | Long-term vision: a database-backed, queryable and online visualizable CNNA map - effectively an interactive semantic mindmap of the formal project - with speech/query instantiated context-docs, expert-review packets, and deep zoom from global structure to Lean sites. This is not current priority and remains secondary to the active Lean/content phases. The same future map should expose merge/no-merge refactor candidates and show where compactness would improve or damage provenance. V1.22 refines this into a Supabase/Postgres public read-only mirror and cnna-project.net web-frontend sidechain with append-only snapshots and no DB truth-source authority. | Single YAML master, generated TSV/JSON/DOT/PDF views, phase/object/proof-dossier records, module inventory, status legends, local theory context ledger, end-theory comparison ledger, future relational or graph database export. | Main side objective Phase 20. Technical database implementation is later and non-blocking, but schema discipline, expert-review semantics, and blue-audit obligations apply immediately. | Principles apply immediately. Technical database export follows after YAML schema and generated views are stable enough for round-trip-safe identifiers and review links. | The database is a documentation/review/query layer. It may expose, analyze, and visualize Lean/YAML-derived metadata, but it cannot supply CNNA-generative axioms, formulas, physics, stochasticity, or established-theory inputs. | V1.22 adds phases 20.15-20.20 and DBR15-DBR20 for Supabase/Postgres schema, YAML/import roundtrip, snapshot/checksum model, public read-only API/RLS views, cnna-project.net frontend data contract and future reviewer/admin model. Technical implementation remains later and non-blocking. |
| SLTG-07 | Geometric-algebra comparison map for later CNNA-derived algebraic and spacetime structures | Quaternion/Pauli/Clifford/geometric-algebra literature provides compact target profiles for rotations, bivectors, pseudoscalars, Clifford signatures and possible spacetime/conformal comparison layers.                    | After CNNA derives relevant CD, boundary-algebra, AQFT/spacetime or side-comparison outputs, the tool can generate a review map showing which GA targets are matched, failed or not yet meaningful.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 | Horn 0709.2238v1, Hestenes references, mathlib Quaternion/CliffordAlgebra docs, Wieser/Song Lean GA formalization, proof dossiers GA0-GA6.                                                                                         | Long-term comparison/review map only; no foundation, no phase release, no Lean generator input.                                                                                          | After GA0-GA6 predecessor phases expose CNNA-derived candidate data; especially CD reintegration and Pillar-B boundary/local-net phases.                                  | GA references remain blue/reference material. A target match is evidence of compatibility, not a source of truth; a mismatch must be recorded rather than patched at the consumer.                                                 | V1.25 adds phases 1.4.9.*, 13.2.1, 13.6.1 and 18.5 plus objects GA0-GA6.                                                                                                                                                                                                                      |

12    Standardized phase-preparation, implementation, and documentation workflows

**What this section shows.**    This section describes repeatable workflows over the Master YAML state: how to rehearse implementability, close a phase, prepare context documentation, add workflows or route missing structures back to their natural origin. It is shown because the main value of the tool is workflow scalability, not merely static tables.

| Workflow                                                     | Trigger                                                                                                                                                                                                                  | Required input                                                                                                                                                                                                                                                                                                            | Required updates                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              | Exit rule                                                                                                                                                                                                                                                                                                                                                                              |
|--------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global no-go guardrail inheritance                           | Every phase preparation, implementation prompt, code review, object documentation update, closeout, pruning decision, or generated-view refresh.                                                                         | top-level global_no_go_guardrails; active phase scratchpad; proposed module/declaration/object changes; operational vs mirror/non-operational layer classification.                                                                                                                                                       | Record that the global guardrails are inherited. Phase-local no_go_guardrails may add stricter local constraints but may not replace, weaken, or scope away the global list. Any exception must be explicitly rejected unless it is already allowed by the global rule text and isolated outside the operational path.                                                                                                                                                                                                        | No phase may be implemented or closed unless global_no_go_inheritance is present in its scratchpad record and no local field contradicts the top-level global guardrails.                                                                                                                                                                                                              |
| Tool/display versioning and Lean-code data timestamp policy  | Any generator, YAML-policy, PDF-display, table-layout, legend, navigation, or workflow-contract change; and any Lean source/data change.                                                                                 | metadata.tool_version; metadata.tool_change_timestamp; metadata.data_timestamp; change classification as tool/display-only versus Lean-code/data-affecting; affected static-finding, scratchpad, or object rows.                                                                                                          | For tool/display-only changes, increment tool_version by 0.01 and update tool_change_timestamp only. For Lean-code/data changes, update data_timestamp/data_version and record the phase/build context. Any materially changed static-finding, scratchpad, or object row must carry a visible change version and timestamp in its generated table view.                                                                                                                                                                       | No release artifact may advance the Lean-code data timestamp unless Lean source/data changed. No table-row correction may remain invisible in version/change metadata when it affects static findings, scratchpad records, or object records.                                                                                                                                          |
| Pre-start feasibility and static-finding triage              | Before starting any active phase after a user-reported green build, and before changing Lean code or closing an infrastructure gate.                                                                                     | active phase_id; current phase dependencies; scratchpad preparation fields; Section 2 static findings with Priority/Issue status/Addressing phase; module manifest; reuse/duplication audit; object proof dossiers when relevant.                                                                                         | State whether the active phase is feasible as infrastructure-only, refactor, or Lean implementation. If a blocking issue is found, add or update a Static code finding row with R/Y/G priority, status, and addressing phase; set or keep the phase red/yellow accordingly and backjump to the natural source layer rather than patching a consumer.                                                                                                                                                                          | Implementation may start only after the active phase has a positive feasibility result or a precisely localized missing bridge. New findings may not remain prose-only; they must be represented in Section 2 with a phase assignment and priority.                                                                                                                                    |
| Pre-Implementation Phase Check / semantic thought experiment | User asks to check the next semantically connected phases in advance, as a Gedankenexperiment, before implementation; also applicable before a risky multi-phase refactor or derived-only bridge sequence.               | Current active cursor; phase table; scratchpad; object register and proof dossiers; module implementation manifest; reuse/duplication ledger; consumption map; static findings; last user-reported green build when available; requested semantic window or the next contiguous phase cluster inferred from dependencies. | For every inspected phase, create/update a pre-implementation check record and mark Y if the phase is implementable under current dependencies, or R if a dependency, object, proof route, module seam, source, or consumer-contract gap is missing. Add newly discovered problems to Static code findings. For every R record, generate one or more upstream addressing phases or a documented merge/backjump target before the blocked phase; do not set the blocked phase active until those addressing phases are closed. | The check closes only when every phase in the semantic window has a Y/R result, each R result has a concrete addressing phase or documented merge target, generated phases have object-link policy and scratchpad stubs, and all changed records carry the current tool version/timestamp. Lean-code data timestamp remains unchanged unless Lean files or Lean inventory are changed. |
| Concrete computable instance traversal                       | Before any operational Lean implementation starts, whenever a computable path, ExecComplex bridge, generated matrix/operator, recurrence, determinant, inverse candidate, or smoke-test route is introduced or modified. | active phase_id; target operational declarations; at least one concrete finite instance or an explicit infrastructure-only justification; expected executable witness; current mathlib imports and known computability risks.                                                                                             | Fill concrete_instance_traversal, computable_path_not_skeleton_status, expected_executable_witness, mathlib_complication_log, noncomputable_boundary_audit, and mathlib_mitigation_or_refactor_layer in the scratchpad. Record whether the instance reaches the intended output object or where it stops.                                                                                                                                                                                                                     | Implementation may start only if the phase either has a concrete instance path through the computable code or is explicitly infrastructure-only. Any mathlib noncomputable leak must be isolated in an allowed mirror/non-operational layer or backjumped to the natural source layer; it cannot silently enter the operational path.                                                  |
| Phase preparation from reliable sources                      | User asks to prepare phase x with sources y,z or supplies established/reliable sources before implementation.                                                                                                            | phase_id; source titles/URLs/files; expected theory layer; optional target objects.                                                                                                                                                                                                                                       | Record source materials; extract theory objects/formulas; map them to CNNA object IDs; update or add object rows; split the phase if dependency depth is too high; fill dependency audit, proof rehearsal, tactic plan, and natural fallback layer. Do not mark the phase green.                                                                                                                                                                                                                                              | Phase remains Y/R/W according to dependency status. A prepared phase has a concrete positive proof path or a precisely localized missing bridge.                                                                                                                                                                                                                                       |
| Implementation from last green baseline                      | User asks to implement the active phase in Lean code.                                                                                                                                                                    | last green package; active phase_id; prepared scratch-pad record; object/phase dependencies; applicable source notes.                                                                                                                                                                                                     | Use positive construction first; preserve import/consumer discipline; add or modify only neutral code-surface modules; record files changed, definitions, proof skeleton, tactics, forbidden-pattern checks, and package result.                                                                                                                                                                                                                                                                                              | If the build is locally confirmed green, set phase G and implementation_status completed; otherwise keep or set active R and add the missing bridge at the natural source layer.                                                                                                                                                                                                       |

| Workflow                                                                | Trigger                                                                                                                                                                                                                               | Required input                                                                                                                                                                                  | Required updates                                                                                                                                                                                                                                                                       | Exit rule                                                                                                                                                                                                                                                                     |
|-------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object and quantities proof documentation workflow                      | A registered object or quantity is introduced, corrected from blue to public-final, exported through a handoff, or used as a proof-relevant code object.                                                                              | object_id;<br>current derivation site;<br>source objects;<br>CNNA definition;<br>intended proof target;<br>phase_id;<br>semantic/API status.                                                    | Create or update the object proof dossier with source objects, definitions, proof goal, proof sketch/proof term reference, verification/audit result, documented yes/no, and link from the object register. Blue objects must record why proof-carrying is not yet semantically final. | An object may be public-final only when the object row and proof dossier agree: documented=yes, semantic status complete, API/handoff rights settled, and verification evidence points to the checked code or explicitly states that Lean build evidence is still local-only. |
| Gap localization and backjump                                           | During preparation or implementation a required object/proof bridge is missing.                                                                                                                                                       | failed target statement;<br>currently available objects;<br>deepest successful dependency;<br>missing lemma/data shape.                                                                         | Do not patch the consumer. Add or activate the earliest natural source phase where the structure should be generated;<br>record why the old phase cannot close;<br>preserve positive-path orientation.                                                                                 | The blocked phase is not closed. A smaller predecessor phase is created or activated with explicit source objects and proof goals.                                                                                                                                            |
| Post-green closeout                                                     | User reports the phase build is green.                                                                                                                                                                                                | compiler result;<br>exact zip/package used;<br>warnings or errors fixed;<br>current phase record.                                                                                               | Fill implementation result;<br>update object statuses;<br>update linked phase-object map;<br>close scratch-pad record;<br>move active cursor to the next phase whose dependencies are complete.                                                                                        | Exactly one active cursor remains. All green phases have complete implementation records;<br>generated tables and PDF compile.                                                                                                                                                |
| Local Lean build evidence rule                                          | Any phase closeout or artifact package mentions build status.                                                                                                                                                                         | Actual Lean build output from the current package or an explicit user report of a local green build.                                                                                            | Record whether the assistant generated artifacts only or whether a Lean build was actually run. Never infer green build from unchanged planning artifacts.                                                                                                                             | If no build was run, the package status is artifact-generated / local Lean build required, not green.                                                                                                                                                                         |
| Consumption classification and pruning discipline                       | A module/declaration appears unused, only BuildAll-reachable, status/audit-like, phase-semantic, or blue-object/API-unfinished.                                                                                                       | module path;<br>declaration name/family;<br>import/reference evidence;<br>object ID if any;<br>proposed consumer or deletion target.                                                            | Classify the item in LEG5/LEG7/LEG8 before moving or deleting it. Decide keep/quarantine/wrap/reexport/archive/deletion-candidate. Update public API contract and firewall if it can be consumed by Phase 3+.                                                                          | No deletion or public export until the item has a class, a consumer rule, and either a neutral API route or an explicit quarantine/deletion-candidate record. Deletion still requires later green build evidence.                                                             |
| Pre-implementation module manifest                                      | Before any Lean implementation phase starts or before an implementation prompt asks to add/modify code.                                                                                                                               | active phase_id;<br>target objects;<br>current module inventory;<br>existing modules with matching semantics;<br>proposed new declarations;<br>import/firewall constraints.                     | Fill the scratchpad module manifest: exact count and names of proposed added modules and modified modules;<br>semantic placement rationale for each;<br>why existing modules are reused/extended or rejected;<br>public/legacy/API role;<br>expected import direction.                 | Implementation may start only if the module budget is explicit and compact. A new module is forbidden unless semantic fit, reuse, and import-firewall checks justify it.                                                                                                      |
| Reuse and duplicate-implementation audit                                | A planned declaration, helper, generator, ledger, request/output object, smoke test, or computation resembles existing code.                                                                                                          | symbol/reference summary;<br>existing generator/API modules;<br>proposed target semantics;<br>object IDs and phase consumers.                                                                   | Record whether the existing module is consumed, extended, wrapped, or rejected. If rejected, explain the semantic mismatch. Mark duplicate risk and update public API/manifest.                                                                                                        | No duplicate implementation is allowed. The same mathematical/computational operation must have one canonical implementation path plus wrappers/reexports if needed.                                                                                                          |
| Canonical Smoke-Test Generator governance                               | A phase proposes generator-like code, experiment request/output code, smoke-test generation, or reusable theory-generation infrastructure.                                                                                            | existing Smoke-Test Generator modules and APIs;<br>target generator semantics;<br>phase/object consumers;<br>import constraints.                                                                | Route through the canonical generator seam whenever semantics match. If extension is needed, extend the canonical generator at its natural layer;<br>do not create a parallel generator. Register any genuine semantic split explicitly.                                               | The canonical generator remains the single generator for the theory where applicable. Parallel generator modules are blocked unless the plan records a proven semantic split.                                                                                                 |
| Secondary long-term code-documentation and derivation-geometry workflow | A request proposes documenting the existing codebase, analyzing the geometry of the formal derivation graph, studying bottlenecks/dominators/source-sink paths, or reflecting on open-system emergence in the formalization topology. | Stable generated repo inventory;<br>object proof dossiers;<br>declaration consumption classification;<br>active not-before gates;<br>explicit derived-only/comparison-only boundary.            | Register the goal as secondary if prerequisites are not closed. If active later, update coverage/dominators/layer/path diagnostics and link them to objects/modules without changing CNNA generative inputs.                                                                           | Outputs are documentation, diagnostics, or comparison reports only. They may guide audits and refactors, but cannot become mathematical or physical premises without a separate CNNA-derived proof path.                                                                      |
| EXEC-2 rational boundary and mirror isolation                           | Any phase mentions ExecComplex, tau, sqrt(D), lattice embedding, Gram entries, eigenvalues, j-invariant, algebraic bridge, or mirror boundary.                                                                                        | Active phase;<br>target object IDs;<br>whether the value is rational/integer operational data or algebraic/analytic mirror data;<br>proof obligation for any proposed operational return value. | Fill exec_complex_boundary_policy and noncomputable_boundary_audit. Update affected object ExecComplex/computable path text. Mark algebraic irrational data as mirror-only unless a rational/integer invariant is explicitly proved and typed.                                         | No phase may introduce sqrt(D), tau, algebraic eigenvalues, or general algebraic complex coordinates into the operational Q x Q path. Operational return from mirror requires a stated invariant and proof target.                                                            |

| Workflow                                            | Trigger                                                                                                                                                                          | Required input                                                                                                                                                                                  | Required updates                                                                                                                                                                                                                                                                    | Exit rule                                                                                                                                                                                                                                           |
|-----------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refactor regression and incremental migration       | Any phase moves declarations, splits a module, introduces wrappers/aliases, quarantines legacy gates, or changes imports.                                                        | Module manifest; declaration list or family; current and target imports; consumer list; local build evidence plan.                                                                              | Fill refactor_regression_protocol and refactor_migration_metrics. Record atomically delivered package boundary, declarations migrated count, import graph delta, consumer breakage audit, and local full-build status source.                                                       | A refactor phase closes only after the delivered package has local full-build evidence. Intermediate wrapper coexistence is allowed; deleting legacy/status material before quarantine closure is not allowed.                                      |
| Lean/mathlib version management                     | Any phase proposes a new mathlib import, encounters noncomputable/classical pressure, or wants newer mathlib API than the frozen baseline.                                       | Baseline version; proposed import; current compile/build evidence; expected mathlib theorem/API; operational vs mirror classification.                                                          | Fill lean_mathlib_version_policy and mathlib_complication_log. Either stay on baseline, open a separate upgrade gate at a phase boundary, or re-route the dependency to mirror/non-operational code.                                                                                | No silent version drift. No operational code may depend on a new mathlib API or noncomputable/classical pressure without an explicit gate and local build evidence.                                                                                 |
| Phase-type-specific scratchpad validation           | Every phase preparation or status change.                                                                                                                                        | phase_type; phase status; target code/object role; active scratchpad.                                                                                                                           | Fill phase_type and phase_type_specific_contract. For refactor phases fill migration/regression fields; for derivation phases fill proof/tactic/mathlib fields; for comparison phases fill derived-only boundary; for infrastructure phases justify absence of operational witness. | A phase cannot become active unless its phase_type-specific evidence is prepared. Not-applicable filler is acceptable only with an explicit infrastructure-only or comparison-only justification.                                                   |
| Governance-depth retrospective after first refactor | When Phase 1.1.2 or the first real code-change/refactor package closes.                                                                                                          | Closed refactor report; list of governance gates used; mistakes prevented; time/complexity overhead; upcoming Phase 3+ structure.                                                               | Fill governance_overhead_review. Decide whether the current depth remains necessary or whether later phases should use a flatter structure with the same global guardrails.                                                                                                         | Do not remove global no-go rules. Only the phase granularity may be flattened, and only after a recorded retrospective.                                                                                                                             |
| Phase 3 to Phase 4 consumer-contract prebinding     | Before preparing Phase 3.6 or Phase 4.1, or any wrapper around BoundaryOperatorProfile / ExecBoundaryMatrix.                                                                     | BoundaryOperatorProfile shape; Operational/ExecComplex consumer needs; import direction; generator policy.                                                                                      | Fill consumer_contract_direction. Phase 3.6 records the exported shape; Phase 4.1 records how it consumes the shape without reconstructing Schur/DtN internals.                                                                                                                     | Phase 3 may not import Phase 4. Phase 4 may not duplicate generator/Schur/DtN logic; it consumes the Phase-3 profile contract.                                                                                                                      |
| Boundary-route extremal audit                       | Any phase that interprets IdealThread, CutSpec.full, Schur recursion, DtN boundary matrices, or string-like analogies.                                                           | Code references for IdealThread singleton carrier/family/coarsen lemmas; CutSpec.full carrier theorem; current generated boundary source; planned consumer shape.                               | Record whether the phase consumes thread-scalar route, full-boundary route, or generated intermediate route. Mark analogical string language comparison-only unless a theorem gives a formal CNNA object.                                                                           | No full matrix/operator, discriminant, spectrum, or physical interpretation may be promoted from the thread route unless the route and lifting theorem are explicitly present and code-checked.                                                     |
| Horizontal/vertical Schur bridge workflow           | A phase attempts to relate Cayley-Dickson/Hurwitz algebra to arithmetic discriminant, CM order, norm, or transfermatrix data through Schur complementation.                      | Closed S05/BR06 horizontal boundary route, closed O05/BR07 vertical arithmetic-shadow route, Transfermatrix objects TM0-TM2, CD7 Hurwitz boundary, and explicit module manifest for the bridge. | Create/update BR08/BR09/CD8 proof dossiers; record commutation/naturality target, failure modes, concrete finite instance traversal, and no-input-backflow audit.                                                                                                                   | The bridge is either proved as a theorem over derived objects, split into smaller prerequisite lemmas, or marked blocked. It may not feed earlier phases unless a separate backreaction/input handoff explicitly permits it.                        |
| Heuristic lattice test-matrix governance            | Whenever Eisenstein/Gauss b-ary tree geometry, angle profiles, CM points, j-invariants, or L_max sweeps are planned or implemented.                                              | code-defined branching object/API; L_max set; embedding kind; angle profile; EXEC-2 boundary status; source objects L04/L06/O05/M05 when j/CM comparisons are used.                             | Record static/dynamic branch rows, concrete finite instance traversal, operational vs mirror fields, expected executable witness, and mathlib/noncomputable complications. Add or update L09/L10/M08/BR10 dossiers.                                                                 | The test may close only if all rows consume the canonical generator/branching API, no duplicate tree generator is introduced, operational assertions are rational/integer/finite, and mirror-only CM/j comparisons cannot feed generator semantics. |
| General early finite computation-test matrix        | Before implementing or promoting any operational computable path, arithmetic wrapper, generator extension, lattice test, or refactor that claims computation is preserved.       | Canonical generator/branching API; finite instance parameters; L_max/branch-mode rows; expected executable witness; optional sentinel/comparison rows; mathlib/noncomputable risk log.          | Fill O07 or a consumer of O07; update concrete_instance_traversal, expected_executable_witness, mathlib_complication_log, and no-go guardrails. Separate generic rows from sentinel rows.                                                                                           | The phase cannot close on hand-picked CM/Eisenstein/Gauss examples alone. At least one generic row family must traverse the actual computable path, or a documented failure/backjump is required.                                                   |
| Regime-typed Heegner/CM finite test matrix workflow | Whenever finite computation tests, Eisenstein/Gauss sentinel rows, Heegner/class-number-one targets, CM/j targets, or noOuter/HasOuter regime claims are planned or implemented. | O07 generic finite rows; derived regime split; code-defined generator/branching API; L_max rows; EXEC-2 boundary; class-number data if Heegner interpretation is claimed.                       | Fill O08/N18/BR11/BR12 dossiers; record regime tag, projection/complement-family status, generic-vs-sentinel status, operational witness, and mirror/comparison columns. Update mathlib/noncomputable log for any class-number/CM dependency.                                       | The phase cannot close if h(D)=1 or a Heegner/j target is used to infer noOuter closure. Generic rows must exist; noOuter-root sentinel rows and HasOuter/projection rows must be distinguished explicitly.                                         |

| Workflow                                                          | Trigger                                                                                                                                                                                                            | Required input                                                                                                                                                                                     | Required updates                                                                                                                                                                                                                                                                                                              | Exit rule                                                                                                                                                                                                                                                                        |
|-------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Computable scalar architecture workflow                           | Any phase introduces scalar data beyond rational ExecComplex, uses mathlib Complex/Real/NumberField/QuadraticAlgebra, or proposes a Cayley-Dickson-derived C-layer.                                                | O00/LEG20/LEG31, module manifest, reuse audit, expected executable witness, mathlib/noncomputable complication log, and CD noncircularity status if CD is involved.                                | Update LEG31/LEG32, O09/O10/BR13/BR14/CD9 dossiers; classify each scalar as rational ExecComplex, exact quadratic schema, proof-carrying D-instantiation, integer/rational invariant, or analytic mirror-only. Record whether a new module is justified or existing module semantics suffice.                                 | No new scalar layer may close without concrete finite instance traversal and proof-carrying projection back to allowed operational invariants. General Complex/Real and CD C-surfaces cannot become generator inputs, and exact quadratic instances require D-source provenance. |
| Derived discriminant-indexed exact quadratic scalar workflow      | Any phase creates or consumes exact quadratic coordinates, theta, sqrt(D)-like notation, CM tau coordinates, quadratic-field/order coordinates, or lattice rows requiring algebraic irrational data.               | O09 schema, LEG32/GNG19, proof-carrying D-source from O05/O06 or equivalent ledger, module manifest/reuse audit, mathlib/noncomputable complication log.                                           | Update O09/O10/BR14/BR13 dossiers; record whether the phase is schema-only, D-instantiation, invariant projection, or mirror comparison. Record concrete finite D-ledger rows and allowed invariant exports.                                                                                                                  | No phase may close with a free sqrt(D), an axiom, or an analytic Complex/CD source for theta. If D is unavailable or semantically blue, backjump to the discriminant-source correction rather than patching the scalar consumer.                                                 |
| Phase-path dependency and object placement audit                  | Before any implementation phase after Phase 4, or when moving/wrapping an object from N/L/M/SP/P/TM/BR/CD groups.                                                                                                  | Object register, source-object list, target module manifest, dependency-depth audit, and current phase-path classification.                                                                        | Update phase title, object Phase field, proof dossier, scratchpad dependency_depth_audit, consumer_contract_direction, and no-go notes. Record whether the object belongs to Path A, Path B, or a late explicit bridge.                                                                                                       | Phase may close only if its title, object group and dependencies agree. Finite spectral/physical consumers cannot be blocked behind modular/j/analytic phases unless a proof-carrying bridge says so.                                                                            |
| Phase-object-link policy workflow                                 | Whenever a phase is added, split, merged, moved, or whenever an object Phase field changes.                                                                                                                        | Phase hierarchy; object register; direct object ownership map; child-phase scope; moved/audit/closeout status.                                                                                     | Update phase Object link policy, Object link explanation, Child object scope, object Phase fields, proof dossiers and phase table generator if needed.                                                                                                                                                                        | The generated phase table may not contain an unexplained empty Linked objects cell. Direct ownership is never inferred from child scope; child-scope summaries are display-only.                                                                                                 |
| Ontic subsystem-minimality workflow                               | Whenever a phase introduces or consumes dynamics, spectra, operator algebra, geometry, arithmetic, stochasticity, open-system language, unitarity, AQFT/physics interpretation, or environment/complement effects. | POST1/LEG35/GNG22; source-object chain from IDEAL_infty formal background to subsystem/cut/approximant, boundary, regime, complement families and Schur/DtN or later certified bridge.             | Update object proof dossier, scratchpad source_to_cnna_mapping, dependency_depth_audit, no-go guardrails, and consumer-contract direction. Mark comparison-only interpretations explicitly and prohibit them from supplying definitions.                                                                                      | A phase may close only if non-subsystem structures are shown as derived consequences or comparison-only interpretations. Any primitive import of dynamics/physics/arithmetic/geometry/environment forces a backjump to the natural subsystem/complement generating layer.        |
| Lean-focus implementation-packet workflow                         | Before a Lean implementation phase starts, or when the user asks for the next semantically connected phases to be checked with minimal cognitive/tooling overhead.                                                 | Active phase, next semantic phase window, object register, scratchpad, module manifest, static findings, import/declaration inventory, and current pre-implementation-check ledger.                | Generate a compact implementation packet and avoid full PDF/declaration dumps unless the phase-check or audit-full mode explicitly requires them. Record G/Y/O/R thought-experiment results, predecessor assumptions, proof risk, and any red addressing phase proposals.                                                     | Lean coding may start only from a compact packet that names relevant modules, producer/consumer objects, red blockers, orange predecessor assumptions, yellow active implementability, forbidden shortcuts, and comparison-only theory boundaries.                               |
| Local theory context versus end-theory comparison workflow        | Whenever a phase or module mentions established mathematical/physical theory, mathlib background, or a large target theory such as AQFT/OQS/modular forms/CM/Moonshine.                                            | Module imports, declared CNNA objects, object proof dossiers, local background-theory context, and end-theory comparison ledger.                                                                   | Classify local established theory as formalization/proof-method/library context; classify large end theories only as comparison/target/consistency horizons. Record that neither role is an ontic CNNA generator unless derived internally.                                                                                   | A module may use established mathematics as formal language, but a CNNA object may close only if its producer is internal provenance. Large end theories remain comparison-only until CNNA derives a bridge object.                                                              |
| DB-REVIEW database-ready documentation and expert-review workflow | Whenever the YAML schema, generated views, phase/object records, proof dossiers, theory/reference markings, online/interactive documentation, or database/export plans are edited.                                 | Lean-code data timestamp; YAML master; phase/object/proof-dossier records; status legend; global no-go guardrails GNG23-GNG24; local theory context/end-theory comparison ledgers when applicable. | Keep Lean as primary truth system, generated views as secondary, and expert review as mandatory. Record whether a row is database-ready-later, review-required, blue-audit-needed, lean-primary, or generated-secondary when those semantics matter. Preserve round-trip-friendly IDs and explicit phase/object/review links. | No generated documentation may close by declaring semantic infallibility or 100-percent truth. Missing blue/reference markings must remain visible as audit debt, and database/export work must not become a CNNA-generative input.                                              |
| Context-filtered documentation slice generation                   | User asks for documentation about a specific object/topic, or a phase closeout requires documenting only the changed context rather than regenerating the whole PDF for human review.                              | Natural-language query or curated profile id; current Single-YAML-Master; regenerated generated_exports/*.tsv; optional slug.                                                                      | Run scripts/generate_tables.py first; run scripts/generate_context_doc.py with query/profile; package context_docs/<slug>/ manifest, section summary, TeX/PDF, and compile log. Add/adjust curated profile terms in YAML if the topic is recurring.                                                                           | Every major documentation section is present in the context packet; each section records matched/total row counts; output states generated-secondary status, Lean-primary rule, and expert-review requirement.                                                                   |

| Workflow                                                                     | Trigger                                                                                                                                                                           | Required input                                                                                                                                                                                                                                       | Required updates                                                                                                                                                                                                                                                                                                                                                                                                    | Exit rule                                                                                                                                                                                                                                                      |
|------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Semantic module consolidation and compatibility-preserving refactor workflow | Before new substantive Lean code after governance closure, or whenever the user asks whether semantically related modules should be merged, compacted, facaded, or kept separate. | LEG10 module manifest;<br>LEG11 reuse ledger;<br>LEG5 consumption map;<br>repo_inventory/raw_export modules/<br>import_edges/symbol references;<br>candidate file list;<br>direct code spot-checks;<br>current public/API and proof-dossier records. | Update LEG36, code_audit findings, reuse_duplication_ledger, scratchpad refactor fields, proposed modules, duplicate-risk symbols, natural-layer placement, facade/compatibility plan, and regression metrics. Set downstream content phases to orange if this gate must precede them.                                                                                                                              | No Lean merge may close without old-module facade or explicit migration plan, import graph delta, declaration/consumer delta, local full-build evidence, and proof that semantic/provenance auditability is preserved or improved.                             |
| Root artifact retention and generated-output cleanup workflow                | Before packaging a tool release, after full/context documentation generation, or when root PDFs/TeX/Markdown reports accumulate.                                                  | Current Repository root file list;<br>Single-YAML-Master;<br>README.md;<br>generated tables/exports;<br>optional generated_docs/full output;<br>archive/reports policy.                                                                              | Keep README.md in root;<br>move historical Markdown reports to archive/reports/;<br>delete disposable root PDF/TeX/LaTeX auxiliary files;<br>ensure full documentation is generated under generated_docs/full/ on demand;<br>update DBR8/GNG27 if classification changes.                                                                                                                                           | Project root contains no retained generated PDF/TeX/LaTeX build products and no active historical Markdown reports beyond README.md. All retained source data remains in YAML/scripts/tables/generated_exports/repo_inventory/repo_snapshot as appropriate.    |
| Root artifact retention and Lean/Lake build-entry preservation workflow      | Before packaging a tool release, after root cleanup, or when Lean/Lake build-control files are added, removed, or moved.                                                          | Package root file list;<br>CNNA.lean;<br>lakefile.lean;<br>lake-manifest.json;<br>lean-toolchain;<br>Repository/repo_snapshot/CNNA source tree;<br>README.md;<br>cleanup script policy.                                                              | Ensure package-root Lean/Lake project-control files are preserved;<br>ensure generated docs/reports remain outside active root;<br>update DBR10/GNG28 and README if the build-entry surface changes.                                                                                                                                                                                                                | Package root contains the source/control files needed for local Lake build and contains no retained generated PDF/TeX/LaTeX byproducts or historical active reports.                                                                                           |
| Root license, README and credit-surface workflow                             | Before packaging a tool release, when licensing/credits change, or when README files appear outside the package root.                                                             | Package root file list;<br>README.md;<br>LICENSE;<br>license_notice table;<br>metadata editor/assistant/<br>minimum_assistant_requirement;<br>full/context documentation generators;<br>cleanup policy.                                              | Keep README.md and LICENSE in package root;<br>remove duplicate active README files in subdirectories;<br>update license_notice/Stats/PDF author metadata;<br>update DBR11/GNG29 and README if credits, license scope, or tested assistant setup changes.                                                                                                                                                           | Exactly one maintained README.md exists at package root;<br>root LICENSE exists;<br>generated full/context PDFs expose Editor and Assistant credits;<br>package contains no root PDF/TeX/LaTeX byproducts.                                                     |
| Generated PDF section-pagebreak workflow                                     | When full or context documentation layout requirements change, especially section-boundary/page-navigation rules for review PDFs.                                                 | Full-document generator, context-document generator, Master YAML metadata, representative full/context PDF outputs, and the user-facing README command surface.                                                                                      | Patch generator preambles or layout macros;<br>keep disposable generated TeX/PDF out of the package root;<br>regenerate tables and representative PDFs;<br>update DBR12/GNG30/SCF49 and README if user commands or layout expectations change.                                                                                                                                                                      | The full documentation PDF and at least one context documentation PDF compile successfully, their generated TeX contains the section-pagebreak hook, and no Lean source or context-matching semantics are changed.                                             |
| Phase status release and red-lock workflow                                   | Before adding phases, changing a phase status, advancing the active cursor, or preparing a Lean-derivation implementation prompt.                                                 | phase row;<br>implementation_scratchpad.phase_type;<br>prerequisite object IDs;<br>proof dossier status;<br>pre-implementation check result;<br>current active cursor;<br>relevant static findings and guardrails.                                   | If phase_type=derivation and the phase is not closed, active, or explicitly implementable-after-predecessors, set it red. To release red, add a pre-implementation check that references already-derived Lean objects and sets yellow only for the unique active cursor or orange for later implementable phases. Keep white only for non-direct-Lean refactor/tool/infrastructure/documentation/comparison phases. | Generated tables pass validation: exactly one yellow phase;<br>zero white derivation phases;<br>red derivation phases carry lock language;<br>any yellow/orange release has explicit prerequisite evidence or a corresponding pre-implementation check record. |
| Documentation section explanation and appendix workflow                      | When a documentation section/table is confusing, redundant, or appears to duplicate a primary control surface.                                                                    | Full-document section order, context-document SECTION_ORDER, static table paragraphs, Master YAML sections, generated exports, and user review feedback.                                                                                             | Add or tighten static generator-owned explanations, keep table rows dynamic, move narrow technical tables to appendix when they are not primary reading surfaces, and update DBR/GNG/static finding records if semantics change.                                                                                                                                                                                    | A reader can identify what each section/table displays, where the data comes from, why it is shown, and which table is authoritative for phase release. No dynamic prose rows are added only to explain static section purpose.                                |
| Pre-substantive-code readiness and proof-gap audit workflow                  | Before starting any new substantive Lean/content implementation, especially before activating 1.1.1.2 or any later red locked derivation phase.                                   | Current full zip;<br>repo_snapshot/CNNA source tree;<br>repo_inventory/raw_export module/import/declaration inventory;<br>generated_exports consumption/object/proof/phase tables;<br>local build result if refactor is executed.                    | Fill LEG37 source-intake ledger;<br>create LEG38 neutral naming/facade plan;<br>execute only approved LEG39 refactor package;<br>regenerate inventory and close LEG40;<br>issue LEG41 release proof or create upstream red blockers.                                                                                                                                                                                | Exactly one active Y phase remains. No new substantive Lean code begins until LEG41 references closed derived-only/verified objects and the stable neutral API/source surface.                                                                                 |

| Workflow                                                   | Trigger                                                                                                                                                                                                 | Required input                                                                                                                                                                                                                                                                 | Required updates                                                                                                                                                                                                                                        | Exit rule                                                                                                                                                                                                                                                                |
|------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Supabase public read-only mirror and web-frontend workflow | When the database/web-publication sidechain is activated or when a Supabase/Postgres mirror, public read-only API, cnna-project.net frontend, reviewer annotation layer or direct importer is designed. | Master YAML, generated TSV exports, repo_inventory/raw_export, tool version, Lean data timestamp, source zip name, YAML/repo inventory hashes, Supabase project URL/anon key for read-only frontend, local service_role key only via .env for admin importer if/when executed. | Add or update DBR15-DBR20, schema/import/RLS/frontend contracts, snapshot/checksum records, RLS/grant tests, public view definitions, README/manual commands and archive report. Never store secrets in repo/chat.                                      | A DB mirror phase may close only when every public row traces to a snapshot_id, anon access is read-only through api.* views, internal/admin schemas are closed, service_role remains server/local-admin only, and a YAML/export roundtrip or import report is archived. |
| Generated PDF typography profile workflow                  | When generated full/context documentation readability or typography scaling changes are requested.                                                                                                      | Full-document generator, context-document generator, table generator, representative full/context PDF outputs, generated TeX audit and README command surface.                                                                                                                 | Patch generator-level size profile, regenerate tables, compile representative PDFs, render sample pages, update DBR21/GNG35/SCF54 and README if user-facing layout expectations change.                                                                 | Generated full and context PDFs compile with the intended typography profile, generated TeX shows the larger size profile, representative pages render without obvious clipping/black-glyph failure, and no Lean/YAML semantics change.                                  |
| Supabase live import activation workflow                   | After Supabase connector access exists and before any live schema/data write to the CNNA Supabase project.                                                                                              | Existing DB phases 20.15-20.20; Supabase project id/ref; Master YAML; generated_exports; repo_inventory; no-go guardrails GNG34/GNG36; explicit current-step user authorization for any write.                                                                                 | Record baseline discovery; design migration package; design importer package; only then apply migration/import on explicit authorization; generate import report/checksums; verify read-only api views/RLS/advisors; update README/report/context docs. | No live write occurs without authorization. After authorized execution, every public DB row must trace to snapshot_id/source hash; public access must be read-only; no Lean file changes are allowed or claimed.                                                         |
| Context-class assignment                                   | Whenever a phase or object is created, moved, reclassified, exported to DB, or rendered in a phase/object table.                                                                                        | Declared Context class from context_class_taxonomy plus phase_type/object provenance/status fields.                                                                                                                                                                            | Master YAML phase/object row; proof dossier if object; scratchpad if phase; generated tables and TSV exports.                                                                                                                                           | No blank Context class; class must not contradict handoff/access rights or generated table semantics.                                                                                                                                                                    |

**Pre-Implementation Phase Check rule.** This workflow is a forward-looking implementation rehearsal, not a Lean build and not a phase closeout. When requested, the next semantically connected phases are inspected as if they were to be implemented in sequence. The phase-logic colors are: green = already closed/derived-only, yellow = the unique active phase is implementable now, orange = a later phase is implementable only in the derivation chain after listed predecessor closures, red = locked/blocked by missing derived-only prerequisite evidence, and white = non-direct-Lean tooling/refactor/infrastructure/documentation/comparison work. Every red result forces a static finding plus an upstream addressing phase at the natural origin of the missing structure before the blocked phase may become active.

**Table legend.** G = green/closed and derived-only; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| ID     | Check status                                      | Meaning                                                                                                                                                                                       | Required action                                                                                                                                                                                               | Ledger effect                                                                                                                                                        |
|--------|---------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| PIPC-G | <span style="background-color: #d9ead3;">G</span> | Closed/derived-only in the inspected window: the phase or gate is already closed and its relevant outputs are available under the current Lean-data timestamp or governance closeout.         | Do not reopen or reimplement. It may be consumed as a completed predecessor if its scratchpad/proof/ledger evidence is present.                                                                               | Record as a closed predecessor in the check output when a window includes already closed phases.                                                                     |
| PIPC-Y | <span style="background-color: #fff2cc;">Y</span> | Active implementable now: the current active phase has all visible prerequisites, object/proof dependencies, import seams, and consumer-contract constraints satisfied at the current cursor. | May be proposed for implementation from the current cursor, subject to normal implementation prompt and post-green closeout. No Lean data timestamp changes during the check itself.                          | Record the Y result with scope now, evidence basis, proof-risk note, and tool version/timestamp in the pre-implementation check output.                              |
| PIPC-O | <span style="background-color: #fce4d6;">O</span> | Implementable in derivation chain: a later phase is not active now, but becomes implementable after the explicitly listed predecessor closures in the thought experiment.                     | Do not activate immediately. Preserve the predecessor assumptions and activate only after the listed chain has actually closed.                                                                               | Record the O result with required predecessor closures and assumptions; it must not count as the unique active phase.                                                |
| PIPC-R | <span style="background-color: #f4cccc;">R</span> | Blocked: at least one required dependency, object, proof bridge, source extraction, module seam, or consumer contract is missing or not naturally generated at the required layer.            | Do not start the blocked phase. Add the finding to Static code findings and generate one or more upstream addressing phases at the natural emergence layer of the missing structure before the blocked phase. | Record the R result, missing dependency, natural addressing layer, generated addressing phase(s), and tool version/timestamp in the pre-implementation check output. |

**Current pre-implementation phase-window check.** This table records the requested forward-looking thought experiment for the next semantic phase window. It is not a Lean build and does not close any checked phase. Yellow means the unique active phase is implementable now. Orange means a later phase is implementable only in the stated derivation chain after predecessor closures. Red means a Lean-derivation phase is locked/blocked by missing derived-only prerequisite evidence and requires a generated upstream addressing/release proof at the natural origin of the missing structure. White means non-direct-Lean tooling/refactor/infrastructure/documentation/comparison work. Green means already closed/derived-only.

### Pre-check summary

**Table legend.** G = green/closed and derived-only; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Required predecessor closures    | 1.1.1.1.5.5;<br>LEG37-LEG41                                                                                                                                                                                                         |
| Assumptions                      | V1.12 inserts a semantic module consolidation gate before 1.1.1.2. The earlier v44 feasibility result remains valid after LEG36 closes or after any resulting bounded refactor package is build-proved.                             |
| Evidence basis                   | YAML phase table, object register, 19 Object status B rows, LEG5 consumption map, proof-dossier anchors, generated inventory summaries.                                                                                             |
| Lean proof risk                  | low/none: planning/generator ledger phase;<br>no Lean source edit expected.                                                                                                                                                         |
| Parent/subphase rule             | not applicable: leaf phase at current active cursor.                                                                                                                                                                                |
| Implementability finding         | Implementable only after the pre-substantive-code readiness chain closes with a release certificate.                                                                                                                                |
| Required action                  | Complete LEG36 first;<br>then implement blue_correction_ledger with semantic defect, allowed temporary consumers, forbidden public consumers, neutral target API, correction phase, and exit-to-white condition for every B object. |
| Would generate addressing phase? | no                                                                                                                                                                                                                                  |
| Generated addressing phase       | none-required                                                                                                                                                                                                                       |
| Static findings affected         | SCF43-SCF45 now precede this result;<br>SCF14 and SCF26 remain addressed when 1.1.1.2 is later implemented.                                                                                                                         |

#### Pre-check detail PIC-2026-05-10-002 – phase 1.1.1.3

| Field                         | Record                                                                                                                                                                         |
|-------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Check status                  | O                                                                                                                                                                              |
| Check mode                    | sequential-thought-experiment                                                                                                                                                  |
| Implementability scope        | after-listed-predecessors                                                                                                                                                      |
| Required predecessor closures | 1.1.1.2                                                                                                                                                                        |
| Assumptions                   | Assumes 1.1.1.2 has closed and LEG7 is generated;<br>consumes LEG5 declaration-consumption map, LEG7 blue-correction ledger, object access clauses, and proof-dossier anchors. |

|                                  |                                                                                                                                                                                                                       |
|----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Evidence basis                   | YAML dependencies, object access register, consumption classification map, planned LEG7 output from 1.1.1.2.                                                                                                          |
| Lean proof risk                  | low/none: public API contract/consumer whitelist planning phase;<br>no Lean wrapper creation expected.                                                                                                                |
| Parent/subphase rule             | not applicable: leaf phase;<br>remains inactive until 1.1.1.2 closes.                                                                                                                                                 |
| Implementability finding         | Implementable in the derivation chain after 1.1.1.2. The phase should only define the visible public surface and forbidden imports for Phase 3+ and later handoffs.                                                   |
| Required action                  | Generate public_api_contract and consumer_whitelist/firewall inputs;<br>exclude uncorrected blue objects, legacy status/policy gates, audit-only objects, duplicate generator seams, and undocumented public objects. |
| Would generate addressing phase? | no                                                                                                                                                                                                                    |
| Generated addressing phase       | none-required                                                                                                                                                                                                         |
| Static findings affected         | No new red finding. Existing open findings remain routed to later phases;<br>this phase only defines the firewall contract.                                                                                           |

Pre-check detail PIC-2026-05-10-003 – phase 1.1.1.4

| Field                            | Record                                                                                                                                                                                                                                                        |
|----------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Check status                     | O                                                                                                                                                                                                                                                             |
| Check mode                       | sequential-thought-experiment                                                                                                                                                                                                                                 |
| Implementability scope           | after-listed-predecessors                                                                                                                                                                                                                                     |
| Required predecessor closures    | 1.1.1.2;<br>1.1.1.3                                                                                                                                                                                                                                           |
| Assumptions                      | Assumes 1.1.1.3 has closed and LEG6 public API/consumer whitelist exists;<br>consumes declaration classification from LEG5 and generated repository inventory/raw_export.                                                                                     |
| Evidence basis                   | YAML dependencies, LEG5 declaration-consumption map, planned LEG6 public API firewall, generated repo inventory/raw_export.                                                                                                                                   |
| Lean proof risk                  | low unless converted into deletion/removal work;<br>as ledger-only pruning classification no Lean source edit is expected.                                                                                                                                    |
| Parent/subphase rule             | not applicable: leaf phase;<br>remains inactive until 1.1.1.2 and 1.1.1.3 close.                                                                                                                                                                              |
| Implementability finding         | Implementable in the derivation chain as a pruning/dead-candidate ledger phase, but not as a deletion phase. It can classify keep/quarantine/wrap/reexport/archive/deletion-candidate entries using existing generated inventory and the public API contract. |
| Required action                  | Generate pruning_ledger. Do not delete or move Lean declarations. Require future local build evidence for any actual deletion/removal phase.                                                                                                                  |
| Would generate addressing phase? | no                                                                                                                                                                                                                                                            |
| Generated addressing phase       | none-required                                                                                                                                                                                                                                                 |
| Static findings affected         | Refines SCF15 but does not close deletion-related risks until a later actual pruning/removal phase with build evidence.                                                                                                                                       |

Pre-check detail PIC-2026-05-10-004 – phase 1.1.1.5

| Field                         | Record                                                                                                                                                                                                    |
|-------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Check status                  | O                                                                                                                                                                                                         |
| Check mode                    | sequential-thought-experiment                                                                                                                                                                             |
| Implementability scope        | after-listed-predecessors                                                                                                                                                                                 |
| Required predecessor closures | 1.1.1.2;<br>1.1.1.3;<br>1.1.1.4                                                                                                                                                                           |
| Assumptions                   | Assumes 1.1.1.2, 1.1.1.3, and 1.1.1.4 have closed;<br>parent 1.1.1.5 is checked as the generated-view authority/inventory-lock closeout, not as implementation of its future 1.1.1.5.x tooling subphases. |
| Evidence basis                | YAML parent/child hierarchy, current active cursor, implementation-scaling phase plan, generated table/export inventory, module-manifest and reuse/duplication ledgers.                                   |
| Lean proof risk               | low/none for parent closeout;<br>future 1.1.1.5.x tool phases are separate and not prerequisites unless explicitly listed.                                                                                |

|                                  |                                                                                                                                                                                                                                                             |
|----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Parent/subphase rule             | Parent closeout does not require future tooling subphases 1.1.1.5.x unless they are explicitly listed as dependencies.                                                                                                                                      |
| Implementability finding         | Implementable in the derivation chain as a closeout/authority-lock phase. It can bind YAML master, generated tables/PDF, README/report update, module-manifest/reuse checks, and local-build evidence requirements into one implementation-prompt contract. |
| Required action                  | Close the audit/planning gate with reproducible generated artifacts and one active next cursor for 1.1.2. Keep 1.1.1.5.x as future tool-scaling subphases unless explicitly activated.                                                                      |
| Would generate addressing phase? | no                                                                                                                                                                                                                                                          |
| Generated addressing phase       | none-required                                                                                                                                                                                                                                               |
| Static findings affected         | No red blocker found;<br>no new addressing phase generated.                                                                                                                                                                                                 |
|                                  |                                                                                                                                                                                                                                                             |

| Assumptions                      | Supabase project aiekahdewadrejrrdajn remains reachable and empty or migration-compatible;<br>user explicitly authorizes the current write step;<br>no Lean files are edited. Separate explicit user authorization is additionally required for any live DB write. |
| Evidence basis                   | Existing phases 20.15-20.20;<br>V1.24 read-only discovery;<br>planned migration/import contracts;<br>GNG34/GNG36.                                                                                                                                                  |
| Lean proof risk                  | none: database/import tooling only;<br>risk is governance/security, not Lean proof.                                                                                                                                                                                |
| Parent/subphase rule             | DB/tooling sidechain under 20;<br>does not affect the unique Lean/content Y cursor.                                                                                                                                                                                |
| Implementability finding         | Implementable after migration/import packages exist and the user explicitly authorizes live DB writes. It must write only Supabase schema/data and produce snapshot/import evidence.                                                                               |
| Required action                  | Before execution, present exact migration/import SQL or script effects, then apply only after explicit confirmation. Afterwards run table/advisor/read-only verification.                                                                                          |
| Would generate addressing phase? | already generated activation chain                                                                                                                                                                                                                                 |
| Generated addressing phase       | 20.22-20.26                                                                                                                                                                                                                                                        |
| Static findings affected         | SCF55                                                                                                                                                                                                                                                              |

### 13 Implementation-scaling phase plan

**What this section shows.** This table records how the planning/documentation tool itself may grow without taking over the mathematical implementation. It distinguishes Python tooling, generated views, future database paths and review infrastructure from Lean-derived CNNA objects.

**Implementation-scaling phase plan.** This table shows how the tool may grow while protecting the Lean/content path. The rows come from the Master YAML and describe Python inventory, generated views, database readiness, context packets, root hygiene and validation surfaces. It is shown to make tooling growth explicit and bounded; none of these scaling rows is an ontic CNNA generator.

| Phase      | Name                                                                | Primary purpose                                                                                                                                                                                                       | Tool mode                                                                                    | Load-control rule                                                                                                                                                                  | Theory semantics                                                                                                                                                                  | Generated artifacts                                                                                                                | Lean-data effect                                             |
|------------|---------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------|
| 1.1.1.5.1  | Tool-mode split and lean-focus contract                             | Define audit-full, phase-check, and lean-focus modes so routine Lean work consumes compact implementation packets instead of full PDF/table scans.                                                                    | lean-focus foundation                                                                        | Full PDF regeneration is not part of ordinary Lean coding; use compact packets unless a governance or audit phase explicitly requests audit-full.                                  | No theory classification yet; this phase only fixes the mode boundary.                                                                                                            | workflow-policy row; scaling-plan TSV/TeX; no Lean code                                                                            | none                                                         |
| 1.1.1.5.2  | Implementation Packet Generator                                     | Generate the phase-local packet with goal, source objects, producer/consumer modules, red blockers, yellow risks, forbidden shortcuts, expected artifacts, and comparison-only warnings.                              | lean-focus                                                                                   | Packet should fit on a small number of pages/rows and link to full TSV/JSON exports rather than embedding full inventories.                                                        | Consumes module-theory/end-theory ledgers once available; before then marks theory context as unknown-not-input.                                                                  | active-phase implementation packet TSV/JSON/TeX                                                                                    | none unless the user explicitly edits Lean code afterwards   |
| 1.1.1.5.3  | Incremental Lean inventory and file-hash cache                      | Avoid rescanning/rendering everything by caching file hashes, module declarations, import edges, and symbol-reference candidates between Lean-data updates.                                                           | phase-check performance layer                                                                | Only changed Lean files and dependent generated summaries are refreshed; full inventory rebuild remains available as audit-full.                                                   | May infer rough local background categories from imports, but must mark them heuristic until semantically confirmed.                                                              | file-hash cache; declaration cache; inventory-delta TSV                                                                            | changes only when Lean files or frozen inventory data change |
| 1.1.1.5.4  | Module theory context ledger                                        | Track local established mathematical background per module as formal language, proof method, library/API context, implementation substrate, or comparison lemma context.                                              | phase-check plus lean-focus lookup                                                           | Start with active/relevant modules only; do not manually annotate all modules at once. Python proposes rows from imports; semantic closure is explicit and phase-bound.            | Local established theory is allowed formalization context, never ontic CNNA generator. Examples: Matrix, Finset, Polynomial, graph/linear algebra, Schur-style algebraic methods. | module-theory-context ledger TSV; active-module slice                                                                              | none for ledger-only updates                                 |
| 1.1.1.5.5  | End-theory comparison ledger                                        | Track large established target theories as comparison-only horizons: AQFT/QFT, OQS, modular forms, CM, elliptic functions/curves, L-functions, Moonshine, renormalization, operator algebras, spectral geometry, etc. | phase-check comparison layer                                                                 | Only record end theories that constrain current or near-future phases; do not build encyclopedia entries.                                                                          | End theories are target structures, consistency checks, terminology alignment, or obstruction/comparison mirrors; forbidden as CNNA producers.                                    | end-theory-comparison ledger TSV; comparison-boundary table                                                                        | none for ledger-only updates                                 |
| 1.1.1.5.6  | Active object graph slices                                          | Render small producer-consumer/provenance neighborhoods around the active phase and active CNNA objects rather than dumping the full object/declaration graph into the PDF.                                           | lean-focus visualization                                                                     | Depth 1-2 graph slices only in PDF; full graph exported as DOT/JSON for optional audit.                                                                                            | Graph edges distinguish internal provenance, local formalization context, and external comparison-only references.                                                                | active-object-neighborhood DOT/SVG/PDF; graph-slice TSV/JSON                                                                       | none unless generated from changed Lean inventory            |
| 1.1.1.5.7  | Red-blocker addressing-phase generator                              | When the pre-implementation thought experiment marks a future phase red, propose an upstream addressing phase at the earliest natural source layer before the blocked phase becomes active.                           | phase-check governance layer                                                                 | Generate concise phase proposals only for red blockers; yellow risks remain notes in the implementation packet.                                                                    | If the blocker is an imported end-theory assumption, route to internal derivation/comparison-boundary phase rather than patching the consumer.                                    | red-blocker phase-proposal TSV; accepted phase rows only after approval                                                            | none until an accepted phase later changes Lean code         |
| 1.1.1.5.8  | Database-ready YAML schema and review-link normalization            | Normalize IDs, phase/object/proof-dossier references, review statuses, and theory-reference markers so the YAML master can later be exported to relational or graph database tables without semantic loss.            | phase-check plus documentation infrastructure                                                | Do not manually annotate the whole repository at once. Start with active/near-active rows and generated consistency checks; keep full database realization as a later export task. | Database fields are review metadata. They may mark local background theory or end-theory comparison context, but they do not create CNNA generators.                              | database-readiness checklist TSV; normalized ID/reference audit; review-status export slice                                        | none for schema/metadata-only changes                        |
| 1.1.1.5.9  | Database export, round-trip, and interactive documentation scaffold | Prepare future YAML-to-DB exports, database-to-generated-view round-trip checks, interactive object/phase exploration, online documentation, and discipline-separated expert-review views.                            | audit-full optional plus generated export layer                                              | Keep export scripts reproducible and optional. Lean implementation packets must remain compact and must not depend on full database exploration.                                   | Interactive views are secondary/generated. They expose review obligations and comparison horizons but never certify semantic truth.                                               | future SQL/SQLite/graph export scripts; schema diagrams; interactive-view JSON; round-trip consistency report                      | none unless future scripts read changed Lean inventory data  |
| 1.1.1.5.10 | Context documentation slices                                        | Reduce documentation overhead by producing topic/phase-specific packets that preserve full section topology while filtering rows to the requested context.                                                            | Python context generator over YAML and generated TSV exports; optional pdflatex compilation. | Use for targeted requests and phase closeouts; reserve full PDF regeneration for tool releases, global audits, or explicit full-document requests.                                 | Generated-secondary navigation/review view only. Absence from a slice is not proof of semantic irrelevance; expert review and blue/reference audit obligations remain.            | context_docs/<slug>/context_filter_manifest.json; context_section_summary.tsv; <slug>_context_documentation.tex; pdf; compile log. | None; no Lean source mutation and no Lean build claim.       |
| 1.1.1.5.11 | Stats front section and interface-metaphor documentation surface    | Keep project-scale facts, repository inventory, graph views, license notices and the tool-interface Leitmetaphor visible without creating another truth layer.                                                        | Python-generated documentation/front matter                                                  | Do not expand the opening section into prose-heavy explanation; keep it as compact facts, concise metaphor, licensing note and existing inventory/graph inclusion.                 | Generated-secondary review architecture only. The metaphor is operational, not ontic or theorematic; Lean-primary and expert-review rules remain dominant.                        | project_stats.generated.tsv; tables/project_stats_table.tex; tables/stats.tex; updated V1.09 full PDF.                             | none; no Lean source or Lean-data timestamp change.          |

| Phase      | Name                                                                              | Primary purpose                                                                                                                                                                | Tool mode                                                                                                                      | Load-control rule                                                                                                                                                                | Theory semantics                                                                                                                                                                             | Generated artifacts                                                                                                                                                                         | Lean-data effect                                       |
|------------|-----------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------|
| 1.1.1.5.12 | Root artifact retention and disposable documentation outputs                      | Keep the project root clean and source-oriented while preserving on-demand generation of full PDFs/TeX and archival access to historical reports.                              | Python full-document generator plus root cleanup script.                                                                       | Do not package regenerated full PDFs/TeX by default. Generate them only for review/export tasks, then keep them in generated_docs/full/ or delete them before release packaging. | Generated documentation outputs remain generated-secondary. Archival Markdown reports are trace records, not authoritative theory sources.                                                   | generated_docs/full/<version>.tex/pdf/log when explicitly generated; archive/reports/*.md for historical reports; generated_exports/root_artifact_cleanup.generated.json when cleanup runs. | none; no Lean source mutation and no Lean build claim. |
| 1.1.1.5.13 | Root license and PDF credit surface                                               | Keep license, editor/assistant credits and minimum tested ChatGPT workflow requirements visible without creating duplicate documentation entry points.                         | Root README/LICENSE plus generator metadata rendering for full/context PDFs.                                                   | Do not duplicate README files in subdirectories; keep license and credit text compact and generated-secondary.                                                                   | Licensing/credits are governance metadata only. They do not affect CNNA derivations, Lean truth status, or expert-review obligations.                                                        | Updated license_notice.generated.tsv; tables/license_notice.tex; generated full/context PDFs with author credits when explicitly compiled.                                                  | none; no Lean source mutation and no Lean build claim. |
| 1.1.1.5.14 | Supabase/Postgres public read-only mirror and cnna-project.net frontend sidechain | Prepare a public query/visualization layer for CNNA planning metadata without replacing Lean/YAML truth and without public write authority.                                    | Postgres/Supabase schemas and read-only api views; local importer; future static/web frontend; no live DB connection in V1.22. | Start as schema/import/view contracts, not as full web application. No PDFs/ZIPs in DB, no service_role key in browser/chat, no manual production table edits.                   | Database/web layer is generated-secondary/publication infrastructure. It can query, visualize and review Lean/YAML-derived metadata, but cannot generate CNNA axioms or release Lean phases. | Future SQL migrations, import reports, snapshot checksums, RLS test reports, frontend data-contract docs and public views; V1.22 adds planning records only.                                | none; no Lean source mutation and no Lean build claim. |
| 1.1.1.5.15 | Supabase live-project import activation and verification package                  | Turn the broad Supabase DB mirror concept into a concrete, auditable no-Lean-change activation path for schema migration, snapshot import and read-only frontend verification. | Supabase connector plus generated SQL/import/report artifacts; explicit authorization before write.                            | Do not combine schema design, import execution and RLS verification. Keep each write/verification step separately reportable and snapshot-addressed.                             | Database rows are generated-secondary publication/query data. They cannot release Lean phases, prove CNNA claims or replace YAML/Lean provenance.                                            | Future database/supabase migrations, importer scripts, import reports, checksum manifests, advisor/RLS reports and frontend data contracts.                                                 | none; no Lean source mutation and no Lean build claim. |

14    Reuse/duplication ledger and canonical generator policy

**What this section shows.**    This ledger tracks reuse seams, duplicated implementation risks, generator boundaries and canonical-source decisions.    It is shown because compactness and reuse are allowed only where provenance and reviewability improve; duplicate generator paths or consumer-side patches are blocked by default.

**Reuse and duplication ledger rule.**    This generated view closes LEG11 as a planning/API hygiene contract.    It is not a Lean source and not a mathematical generator.    A future generator-like implementation must be classified here before code is added: consume an existing seam, extend it at its natural source layer, wrap it for import/API reasons, or record a genuine semantic split.    Parallel request/output, extraction, ledger, smoke-test, or theory-generation paths are blocked by default.

Reuse ledger row RD01 – generated ToC/smoke source and main-path construction

| Field                   | Record                                                                                                                                                                                                      |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                      | RD01                                                                                                                                                                                                        |
| Scope                   | generated ToC/smoke source and main-path construction                                                                                                                                                       |
| Existing canonical seam | CNNA.PillarA.Arithmetic.Smoke.GeneratedSource and CNNA.PillarA.Arithmetic.Smoke.GeneratedMainPath, backed by CNNA.PillarA.ToC.GeneratedBranchFamily                                                         |
| Decision                | consume_or_extend_existing                                                                                                                                                                                  |
| Allowed action          | Future generated ToC/smoke phases must consume or extend the existing source/main-path seam at its natural layer.                                                                                           |
| Blocked duplication     | No second smoke-test generator, generated carrier source, or parallel main-path constructor under a phase-local module name.                                                                                |
| Evidence                | GeneratedSource exposes regular/variable smoke carriers and SM0 ledger;<br>GeneratedMainPath exposes generatedMainPath, regular/variable paths, pair ledger, and no-CutSpec/no-matrix-data boundary status. |
| Future consumers        | Phase 5 experiment request/output, O07 generic finite computation-test matrix, later generated arithmetic source phases.                                                                                    |

Reuse ledger row RD02 – downstream generated Schur/DtN/arithmetic smoke chain

| Field                   | Record                                                                                                                                                            |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                      | RD02                                                                                                                                                              |
| Scope                   | downstream generated Schur/DtN/arithmetic smoke chain                                                                                                             |
| Existing canonical seam | CNNA.PillarA.Arithmetic.Smoke.GeneratedApproximantCore through GeneratedOperationalQuadraticDiscriminantSourceFromSM9g1Window                                     |
| Decision                | consume_existing_mainline                                                                                                                                         |
| Allowed action          | Future consumers may consume the proof-carrying generated chain and add natural source-layer extensions when a missing structure is exposed.                      |
| Blocked duplication     | No independent Schur/DtN/arithmetic generator that recomputes the same provenance chain outside the Generated* mainline.                                          |
| Evidence                | The robust semantic mainline graph and generated module chain already route source -> boundary/interior -> Schur/DtN -> arithmetic/charpoly/discriminant objects. |
| Future consumers        | Phase 3/4 boundary-operator profiles, Phase 5 computation requests, O05/O06/O07/O08 operational arithmetic checks.                                                |

Reuse ledger row RD03 – action-candidate generator semantics

| Field                   | Record                                                                                                                                                                                                 |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                      | RD03                                                                                                                                                                                                   |
| Scope                   | action-candidate generator semantics                                                                                                                                                                   |
| Existing canonical seam | CNNA.PillarA.Arithmetic.Actions.GeneratorActionInventory and CNNA.PillarA.Arithmetic.Actions.ActionFormatDecision                                                                                      |
| Decision                | genuine_semantic_split_already_existing                                                                                                                                                                |
| Allowed action          | Action-like requests must consume or extend the action inventory/decision seam, because it classifies action formats rather than generated ToC/smoke carriers.                                         |
| Blocked duplication     | No action-format generator reimplemented inside Smoke or later CM/CD consumers.                                                                                                                        |
| Evidence                | GeneratorActionInventory records candidate kinds/statuses and ActionFormatDecision consumes it to classify level-history identity, branching, bright/dark, Mobius-Schur, CM, and CD action candidates. |
| Future consumers        | AR/action-format phases, later CM/CD/action comparison gates.                                                                                                                                          |

Reuse ledger row RD04 – documentation and planning-table generation

| Field | Record |
|-------|--------|
|-------|--------|

|                         |                                                                                                                                                     |
|-------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                      | RD04                                                                                                                                                |
| Scope                   | documentation and planning-table generation                                                                                                         |
| Existing canonical seam | masters/cnna_roadmap_master.yaml plus scripts/generate_tables.py                                                                                    |
| Decision                | artifact_only_split                                                                                                                                 |
| Allowed action          | Planning/PDF/TSV views are generated from the single YAML master only.                                                                              |
| Blocked duplication     | No independent proofbook, phase table, object list, module manifest, or reuse ledger source outside the YAML master.                                |
| Evidence                | generate_tables.py validates the single master and renders object, phase, scratchpad, module manifest, proof documentation, and reuse ledger views. |
| Future consumers        | All planning/documentation phases, implementation prompts, public API classification.                                                               |

Reuse ledger row RD05 – repo inventory/import graph generation

|                         |                                                                                                                                                        |
|-------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field</b>            | <b>Record</b>                                                                                                                                          |
| ID                      | RD05                                                                                                                                                   |
| Scope                   | repo inventory/import graph generation                                                                                                                 |
| Existing canonical seam | scripts/build_export_script_v1.8.py and repo_inventory/raw_export                                                                                      |
| Decision                | artifact_only_audit_not_ontic_generator                                                                                                                |
| Allowed action          | Use inventory data for module placement, import graph diagnostics, and documentation/audit only.                                                       |
| Blocked duplication     | Do not treat graph metrics as CNNA-generative evidence and do not create a second inventory generator for the same source snapshot.                    |
| Evidence                | raw_export contains modules/import edges/symbol-reference summaries;<br>phase plans classify these as secondary audit assets, not mathematical inputs. |
| Future consumers        | LEG10/LEG11/LEG5/LEG6, module inventory views, later documentation/audit phases.                                                                       |

Reuse ledger row RD06 – future experiment request/output infrastructure

|                         |                                                                                                                                                            |
|-------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field</b>            | <b>Record</b>                                                                                                                                              |
| ID                      | RD06                                                                                                                                                       |
| Scope                   | future experiment request/output infrastructure                                                                                                            |
| Existing canonical seam | No separate code yet;<br>must route through RD01/RD02 and LEG10 manifest before code.                                                                      |
| Decision                | future_consume_or_wrap_canonical_generator                                                                                                                 |
| Allowed action          | Define request/output wrappers only after the manifest proves the wrapper consumes the canonical generated chain and does not generate data independently. |
| Blocked duplication     | No parallel experiment request/output generator, extraction generator, or ledger generator under Phase 5 or O07 names.                                     |
| Evidence                | LEG10 already records duplicate-risk symbols;<br>LEG11 now turns them into an explicit block unless a semantic split row is added.                         |
| Future consumers        | Phase 5, O07 generic finite computation-test matrix, heuristic lattice and regime-typed test matrices.                                                     |

Reuse ledger row RD07 – future neutral generator API possibility

|                         |                                                                                                                                           |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| <b>Field</b>            | <b>Record</b>                                                                                                                             |
| ID                      | RD07                                                                                                                                      |
| Scope                   | future neutral generator API possibility                                                                                                  |
| Existing canonical seam | Current semantics live in Smoke/GeneratedSource-MainPath;<br>no neutral module exists yet.                                                |
| Decision                | defer_until_code_phase_proves_need                                                                                                        |
| Allowed action          | Create a neutral wrapper/API only if a later manifest shows the Smoke namespace is semantically too narrow but the operation is the same. |
| Blocked duplication     | No neutral generator file created merely to rename existing semantics or to bypass import/firewall discipline.                            |

|                  |                                                                                                                       |
|------------------|-----------------------------------------------------------------------------------------------------------------------|
| Evidence         | The v41 gate closes governance only;<br>no Lean source change is required to make the policy enforceable in planning. |
| Future consumers | 1.1.1.3 public API contract, future refactor phases, Phase 5 generator consumers.                                     |

Reuse ledger row RD08 – semantic module consolidation and compatibility-preserving code compactness

| Field                   | Record                                                                                                                                                                                                                                    |
|-------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ID                      | RD08                                                                                                                                                                                                                                      |
| Scope                   | semantic module consolidation and compatibility-preserving code compactness                                                                                                                                                               |
| Existing canonical seam | LEG10 module manifest;<br>LEG11 reuse/duplication ledger;<br>LEG5 declaration consumption classification;<br>repo_inventory/raw_export import/declaration graph;<br>old Lean module import paths as compatibility seams                   |
| Decision                | defer_until_code_phase_proves_need                                                                                                                                                                                                        |
| Allowed action          | Unify semantically identical schema/wrapper families only through a recorded LEG36 candidate row, old-module facades, declaration/consumer diff, and local build evidence. Prefer canonical schema modules at the natural producer layer. |
| Blocked duplication     | No continued proliferation of unrelated clone wrappers once a canonical schema is validated;<br>no aggressive merge of proof-stage chains, generated SM phase modules, or Cayley-Dickson S6 stages without provenance-preservation proof. |
| Evidence                | V1.12 code spot-check: BoundarySource substrate ledger clone family;<br>Handoff A_to_C/D/E alias family;<br>Handoff B/C/D/E_to_A feedback-input family;<br>no-merge warning for Smoke/SM and Cayley-Dickson proof chains.                 |
| Future consumers        | Phase 1.1.1.1.5;<br>Phase 1.1.1.2;<br>public API/firewall work;<br>pruning/refactor phases;<br>future Lean implementation prompts.                                                                                                        |

## 15 Declaration consumption classification map

**What this section shows.** This section summarizes generated declaration-consumption classification. It separates semantic consumption from mere import reachability and exports the full records as TSV. The PDF renders summaries so reviewers can see the API/firewall shape without reading an unreadable declaration dump.

**Declaration consumption classification rule.** LEG5 is a generated planning/API-hygiene artifact, not a Lean source and not a mathematical generator. The classifier distinguishes semantic consumption from mere BuildAll/import reachability. Full module-, declaration-, and object-level records are exported as TSV files; the PDF renders only the class policy and aggregate counts to avoid turning the roadmap into an unreadable declaration dump.

| Class                    | Meaning                                                                                                                 | Evidence rule                                                                                                                                                                          | Public/API disposition                                                                           | Blocked promotion rule                                                                                                     |
|--------------------------|-------------------------------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|--------------------------------------------------------------------------------------------------|----------------------------------------------------------------------------------------------------------------------------|
| core-computational       | Internal derived computational definitions that are neither policy, wrapper, phase alias, nor proof-only bridge.        | Pillar-A internal module/declaration without governance, wrapper, smoke-phase, obstruction, or proof-bridge markers; module reference counts are evidence only, not public API rights. | May be used internally by later derived phases after import/consumer discipline is checked.      | Cannot become public-final merely because it is imported; public API contract and object proof dossier are still required. |
| proof-bridge             | Certificates, equality bridges, correctness/witness declarations, and other proof-carrying connectors.                  | Names/modules carrying proof, certificate, correctness, identity, witness, equality, or bridge roles.                                                                                  | May discharge local proof obligations but is not automatically a public object.                  | Cannot hide a missing natural source structure; if a consumer needs new structure, backjump to the source layer.           |
| public-wrapper           | BuildAll, umbrella, or import-facing wrapper modules whose purpose is exposure/routing rather than semantic generation. | Inventory flags build modules, top-level pillar wrappers, or module names ending in BuildAll.                                                                                          | Exposure surface only; it may route imports after public API rules are closed.                   | Wrapper reachability is not semantic consumption evidence and cannot make a blue object final.                             |
| legacy-status            | Legacy/status-gate declarations or modules that encode old one-constructor states or deprecated status control.         | Name/path contains legacy or status-gate/status markers.                                                                                                                               | Quarantine/refactor candidate, normally hidden behind legacy/status policy.                      | Cannot be consumed by implementation phases except through the explicit quarantine/correction path.                        |
| legacy-policy            | Policy, ledger, decision, format, audit, inventory, report, and governance/control-surface material.                    | Name/path/layer contains policy, ledger, decision, format, audit, inventory, contract, report, planning, governance, or legacy control markers.                                        | May govern work; does not supply ontic or mathematical CNNA input.                               | Cannot be cited as derived mathematical structure; must stay prose/planning/audit unless mirrored by checked source.       |
| phase-alias              | Phase- or smoke-test-specific names carrying implementation-history aliases such as SM-numbered records.                | Name/module contains SM-numbered aliases or lives in Smoke namespace.                                                                                                                  | Internal migration/scaffold evidence only; later public names must be neutral.                   | Cannot become stable public API without wrapper/correction and consumer whitelist.                                         |
| audit-only               | Read-only diagnostic or inventory material not part of the CNNA generator chain.                                        | Non-Pillar-A, unclassified, or diagnostic inventory material without derived generator role.                                                                                           | Documentation/diagnostic evidence only.                                                          | Cannot be used as ontic input or proof of mathematical closure.                                                            |
| blue-semantic-correction | Proof-carrying but semantically/API-incomplete objects that must be corrected before final/public consumption.          | Object status B in the object register; declarations/modules may later be linked by the blue-correction ledger.                                                                        | Blocked from public-final consumption; only temporary internal correction consumers are allowed. | Must not be classified as final-output or public-wrapper before correction phase, proof dossier, and API contract close.   |
| dead-candidate           | Rejected, blocked, negative, impossible, obstruction, or black/quarantined candidates.                                  | Names/path contain NoGo/obstruction/blocked/dead/impossible/negative or object status R/K.                                                                                             | No direct public/API consumption; may be cited as obstruction evidence only.                     | Cannot be deleted or repurposed before the pruning/dead-candidate ledger closes.                                           |
| final-output             | Intentional output candidates or green documented objects after proof/audit closure.                                    | Architectural sink taxonomy intentional output, or green documented non-governance object in the object register.                                                                      | Candidate final output, still subject to explicit public API contract and consumer whitelist.    | A blue/quarantined object can never enter this class directly; documented proof alone is insufficient.                     |

### Generated classification counts

| Class                    | Modules | Declarations | Objects | Public/API disposition                                                                           |
|--------------------------|---------|--------------|---------|--------------------------------------------------------------------------------------------------|
| audit-only               | 1       | 2            | 0       | Documentation/diagnostic evidence only.                                                          |
| blue-semantic-correction | 0       | 0            | 19      | Blocked from public-final consumption; only temporary internal correction consumers are allowed. |
| core-computational       | 133     | 3512         | 82      | May be used internally by later derived phases after import/consumer discipline is checked.      |
| dead-candidate           | 1       | 129          | 89      | No direct public/API consumption; may be cited as obstruction evidence only.                     |
| final-output             | 7       | 21           | 13      | Candidate final output, still subject to explicit public API contract and consumer whitelist.    |
| legacy-policy            | 29      | 1705         | 37      | May govern work; does not supply ontic or mathematical CNNA input.                               |
| legacy-status            | 0       | 2            | 0       | Quarantine/refactor candidate, normally hidden behind legacy/status policy.                      |
| phase-alias              | 75      | 2494         | 0       | Internal migration/scaffold evidence only; later public names must be neutral.                   |
| proof-bridge             | 10      | 995          | 0       | May discharge local proof obligations but is not automatically a public object.                  |
| public-wrapper           | 31      | 0            | 0       | Exposure surface only; it may route imports after public API rules are closed.                   |

**Promotion gate.** A blue object is always classified as **blue-semantic-correction**. It cannot become **final-output** or **public-wrapper** from proof-carrying code alone; later phases must close the semantic correction ledger, proof dossier, and public API contract.

## 16 Canonical object register with code derivation sites

**What this section shows.** This register is the canonical object/quantity index maintained in the Master YAML. It shows object status, derivation/provenance text, code locations, access rights, handoff rights and proof-dossier links. It is shown before the phase table so phase release can be checked against registered objects.

**Object register rule.** This section renders object-to-code, context class, derivation, access, handoff rights, and proof-documentation links from the Single YAML Master. It is shown because phase release must cite registered derived-only objects rather than relying on informal intent. Context class separates Lean objects from tool, generated, database, documentation, governance and reference-gate objects; Significance tier controls the documentation burden from F0 full dossier to F4 mention-only; object status remains release/proof-state only. Legends are local to the object tables that carry colored object-status cells.

### Object table A: current code modules

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| ID  | Object                                       | Context class                            | Tier | Layer                 | Object status | Code status                                                                | Current code modules / derivation site                                                                                                                                                                             | Neutral target location / canonical API          | Phase |

### Object table B: derivation, Exec path, and status

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| ID  | Object                        | Context class                   | Tier | Object status | Canonical CNNA definition                                                                                                                     | Natural provenance                                     | Computed from                                       | ExecComplex/computable path                                                                                                                                    | Priority | Phase |

| GA6   | Geometric and conformal algebra side-comparison register | Reference; Gate; Object      | F2   | K             | A side-comparison register for geometric algebra, spacetime algebra and conformal geometric algebra as external target surfaces for already-derived CNNA outputs.                                                                                           | Horn outlook and related GA/CGA reference literature; CNNA side-comparison Phase 18.                                                                                            | GA0-GA5 and future derived CNNA outputs; never from external GA as a foundation.                                                                                                                                                      | None. Documentation/review comparison metadata only.                                                     | secondary-reference         | 18.5  |
| DBR27 | Phase/Object context-class taxonomy                      | Tool; Infrastructure; Object | F3   | G             | Generated-secondary context-class taxonomy: every phase/object row carries an explicit Context class separating Lean mathematical objects, Lean-facing contracts/refactors/governance, tool/database/generated/documentation artifacts and reference gates. | User-requested correction that objects and phases must be classified by overarching context; OOP principle: class/type identity must be visible and separate from state/status. | Schema extension from V1.25 plus second-pass semantic class audit: phase/object rows receive Context class; Lean-facing refactor/contract/governance rows are separated from tool-only rows and mathematical Lean source/target rows. | Not applicable; no mathematical computation. This is schema/classification metadata for review surfaces. | critical-tooling-governance | 20.27 |

### Object table C: access, handoff, and consumer rights

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| ID  | Object                                    | Context class                   | Tier | Object status | Pillar-A access                                                   | Handoff rights                                                                           | May be consumed by                                    | Current code modules / derivation site                                                                                                                                                                   | Phase |

### Object table D: proof-documentation status and proofbook links

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

## 17    Object and quantities proof documentation

**What this section shows.**    This generated proofbook section gives one dossier row per registered object or quantity. A dossier is not automatically a Lean proof: it states source objects, definitions, proof targets, proof sketches and verification status. It is shown so expert review can inspect each object without reading the entire repository.

**Object and quantities proof-documentation workflow.**    This section is generated from the object proof-dossier records in the Master YAML. It is the proofbook infrastructure. Every registered object or quantity has a scratchpad-style dossier. A dossier is not automatically a Lean proof; it records the source objects, definition, proof target, proof sketch, and verification status that must be checked against code. Blue objects may be proof-carrying yet semantically/API-unfinished; their dossier must state that gap before any public-final promotion.

### Object or quantity G00 – Generator provenance

**Table legend.**    W = white/finished public object;   B = blue/proof-carrying but semantic/API correction still open;   G = green/locally closable;   Y = yellow/known route with prerequisites;   R = red/derivation layer incomplete or unclear;   K = black/registered side or future target. Context class is orthogonal to status.

| Field                           | Record                                                                                                                                                                                                                                                                                                              |
|---------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Object ID                       | G00                                                                                                                                                                                                                                                                                                                 |
| Object status                   | G                                                                                                                                                                                                                                                                                                                   |

| Proof target                    | Not yet documented in v25 proofbook. Must be filled before public-final promotion or handoff exposure.                                                                                                                                                                                                           |
| Proof sketch                    | Pending. Use checked code derivation site as primary evidence; prose is secondary and must not introduce new assumptions.                                                                                                                                                                                        |
| Verification / audit            | Pending. For blue objects, semantic/API correction remains required even if proof-carrying code exists.                                                                                                                                                                                                          |
| Next documentation action       | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty. Fill during the object’s natural correction/implementation phase; do not duplicate in phase-local prose. |

### Object or quantity CD0 – Cayley-Dickson source

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Source objects                  | BR08/BR09; CD normSq and norm-multiplicativity data CD3/CD6/CD7; arithmetic discriminant/norm route O05 and later N-objects; transfermatrix route TM0-TM2.                                                                                                                                                                     |
| Definitions                     | CDArithmeticCompatibilityProfile as a corollary of horizontal/vertical Schur-duality, not as a free norm analogy.                                                                                                                                                                                                              |
| Proof target                    | Prove that the CD-side norm structure and arithmetic-side norm/discriminant structure are compatible because both are derived from the same multiscale Schur decomposition, under the exact hypotheses proved in BR08.                                                                                                         |
| Proof sketch                    | Defer proof until BR08 is closed. Do not use source-file similarity, physical analogy, or Hurwitz/CM comparison prose as proof. First export precise norm objects from both routes, then build a coordinate/entry-level bridge.                                                                                                |
| Verification / audit            | Current code modules are source/seed only. The v31 audit corrects the derivation order: Phase 6.5 may collect preconditions but not close CD8.                                                                                                                                                                                 |
| Next documentation action       | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. When Phase 10.4.2 activates, split if necessary into norm-source alignment, coordinate bridge, and final compatibility theorem. |

### Object or quantity L00 – Lattice embedding Lambda -> C

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Field                           | Record                                                                                                                                                                        |

| Documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.            |
| Documented                      | no                                                                                                                                                                                       |
| Phase                           | 8.8                                                                                                                                                                                      |
| Source objects                  | q=exp(2pi i tau).                                                                                                                                                                        |
| Definitions                     | JQExpansionProfile.                                                                                                                                                                      |
| Proof target                    | Not yet documented in v25 proofbook. Must be filled before public-final promotion or handoff exposure.                                                                                   |
| Proof sketch                    | Pending. Use checked code derivation site as primary evidence; prose is secondary and must not introduce new assumptions.                                                                |
| Verification / audit            | Pending. For blue objects, semantic/API correction remains required even if proof-carrying code exists. v37 audit: modular/CM path only; cannot gate finite spectral/physical consumers. |
| Next documentation action       | Fill during the object’s natural correction/implementation phase; do not duplicate in phase-local prose.                                                                                 |

Object or quantity M07 – Hilbert class polynomial H\_D

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                  |
| Documented                      | no                                                                                                                                                                                             |
| Phase                           | 10.3                                                                                                                                                                                           |
| Source objects                  | Eigenvalues or matrix exponential seed.                                                                                                                                                        |
| Definitions                     | HeatKernelProfile.                                                                                                                                                                             |
| Proof target                    | Not yet documented in v25 proofbook. Must be filled before public-final promotion or handoff exposure.                                                                                         |
| Proof sketch                    | Pending. Use checked code derivation site as primary evidence; prose is secondary and must not introduce new assumptions.                                                                      |
| Verification / audit            | Pending. For blue objects, semantic/API correction remains required even if proof-carrying code exists. v37 audit: must verify no Phase 8/9 modular or j dependency unless explicitly bridged. |
| Next documentation action       | Fill during the object’s natural correction/implementation phase; do not duplicate in phase-local prose.                                                                                       |

### Object or quantity SP3 – Spectral zeta zeta\_H

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Definitions                     | ConsumptionClassificationMap with classes core-computational, proof-bridge, public-wrapper, legacy-status, legacy-policy, phase-alias, audit-only, blue-semantic-correction, dead-candidate, final-output;<br>generated module/declaration/object consumption records.                                                                                                                                                                                                                         |
| Proof target                    | Classify declarations/modules/registered objects conservatively before blue correction and public API work: BuildAll/import reachability is not semantic consumption;<br>blue objects are never public-final;<br>full records are generated as TSV evidence.                                                                                                                                                                                                                                   |
| Proof sketch                    | Extend scripts/generate_tables.py so the single YAML master defines the permitted classes and the generator validates that exact class set. Read the frozen repo inventory and symbol-reference JSON, classify modules and declarations by deterministic evidence rules, classify object-register rows with B objects forced to blue-semantic-correction, export full TSV ledgers, and render a compact PDF policy/count section. No Lean source move or mathematical generator is introduced. |
| Verification / audit            | v43 generator run validates the consumption_classification_map section and emits consumption_classification_map.generated.tsv, module_consumption_records.generated.tsv, declaration_consumption_records.generated.tsv, and object_consumption_classification.generated.tsv. The blue-object gate is checked in the generator;<br>no Lean source was changed and no new Lean build is claimed from this environment.                                                                           |
| Next documentation action       | Phase 1.1.1.2 consumes the object_consumption_classification ledger to build the blue-object semantic correction ledger;<br>1.1.1.3 later consumes it for public API/consumer whitelist rules.                                                                                                                                                                                                                                                                                                 |

Object or quantity LEG7 – Blue-object semantic correction ledger

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Definitions                     | ModuleImplementationManifest is the generated scratchpad contract requiring exact added/modified modules, reusable existing modules, semantic placement, rejection of alternative placements, public/legacy/API role, import direction, expected consumers, phase type, regression protocol, version impact, concrete finite traversal, generic test placement, mathlib risk, and noncomputable boundary audit before Lean code changes. |
| Proof target                    | Future implementation phases cannot start with unnamed modules, hidden consumer direction, duplicated generator/test infrastructure, or unclassified mathlib/noncomputable pressure.                                                                                                                                                                                                                                                     |
| Proof sketch                    | Extend the single-master generator so every scratchpad record must carry the module-manifest fields. Render a module-manifest table and TSV from those fields. Mark 1.1.1.1.1 as infrastructure-only closure: no Lean source move, no operational object, no build claim. Set the next active cursor to 1.1.1.1.2 so generator reuse is audited after named module placement exists.                                                     |
| Verification / audit            | scripts/generate_tables.py validates mandatory manifest fields and generated module-manifest artifacts were regenerated in v40. No Lean source was changed and no Lean build is claimed.                                                                                                                                                                                                                                                 |
| Next documentation action       | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. During 1.1.1.1.2, consume LEG10 to classify generator-like future code as consume, extend, wrap, or genuine semantic split; later Lean phases must fill phase-specific manifest content before edits.                                     |

Object or quantity LEG11 – Reuse/duplication ledger and canonical generator policy

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Field                           | Record                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |

Enough detail for later implementation without re-reading chat history.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Documented                      | yes                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Phase                           | 1.1.1.1.2                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Source objects                  | LEG10, repo_inventory/raw_export/symbol_reference_summary.json, existing Smoke/Test generator modules, and planned target objects.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Definitions                     | ReuseDuplicationLedger plus CanonicalGeneratorPolicy: no second implementation of an already available semantic operation; generator-like request/output, smoke-test, extraction, and ledger code must reuse or extend the canonical theory/smoke-test generator seam.                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Proof target                    | Close LEG11 as a generated governance ledger: every future generator-like operation must be classified as consume existing, extend existing, wrap existing, or genuine semantic split before Lean implementation; duplicate generator/request/output/extraction/ledger paths are rejected by default.                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Proof sketch                    | Use LEG10 module-manifest data and the frozen repo inventory to locate the existing generator seams. The operational generated source/main path is already represented by CNNA.PillarA.Arithmetic.Smoke.GeneratedSource and GeneratedMainPath, with downstream generated SM modules consuming that route. Action-like generator semantics are separately recorded by GeneratorActionInventory and ActionFormatDecision. Documentation and repo-inventory scripts are artifact generators, not CNNA mathematical generators. Therefore LEG11 records one canonical extension rule: same semantics must consume, extend, or wrap the natural existing seam; only a ledger-recorded semantic split may justify a separate generator. |
| Verification / audit            | v41 adds the reuse_duplication_ledger top-level YAML section, generator validation/rendering in scripts/generate_tables.py, tables/reuse_duplication_ledger.tex, and generated_exports/reuse_duplication_ledger.generated.tsv. No Lean source was changed. The user reported the prior Lean build green before this infrastructure-only update; no new Lean build is claimed from this environment.                                                                                                                                                                                                                                                                                                                               |
| Next documentation action       | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. Phase 1.1.1.1.3 now consumes documented LEG11 while closing object/proof-dossier infrastructure; later implementation prompts must consult the reuse ledger before adding any generator-like code.                                                                                                                                                                                                                                                                                                                                 |

Object or quantity LEG12 – Object and size proof-documentation infrastructure

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Source objects                  | object register;<br>object_proof_dossiers;<br>LEG10 module manifest gate;<br>LEG11 reuse/duplication policy;<br>blue-object correction requirements;<br>generated single-master views.                                                                   |
| Definitions                     | ObjectProofDossier infrastructure: one generated dossier row per registered object/quantity, with canonical proof:<ID> link from the object register and generated anchor in the proof-documentation section.                                            |
| Proof target                    | Every registered object/quantity has a non-empty proof-documentation status, an exact proof:<ID> proof-dossier link, and exactly one matching object_proof_dossiers row with required source, definition, target, sketch, audit, and next-action fields. |

|                           |                                                                                                                                                                                                                                                                                                                                                                                                               |
|---------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof sketch              | scripts/generate_tables.py loads the single YAML master, validates the object register, validates object_proof_dossiers against object IDs, requires exact proof:<ID> object links, checks non-empty required dossier fields, and checks object/phase agreement before generating TSV/PDF tables. No mathematical proof content is inferred from documentation alone.                                         |
| Verification / audit      | v42 generator run succeeded with 199 objects and 199 proof-dossier records. The PDF proof-documentation section and object proof-link table were regenerated. Lean source was not changed and no Lean build is claimed for this documentation-only gate.                                                                                                                                                      |
| Next documentation action | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. Consumed by 1.1.1.1.4 for declaration classification. Later object phases must fill no/partial dossiers at their natural source layer and cannot promote blue/public-final objects on name-only documentation. |

| Phase                           | 1.1.1.1.0                                                                                                                                                                                                                                                                                                                                  |
| Source objects                  | User-specified no-go list; prior implementation constraints; LEG4 import firewall; LEG10 module manifest; LEG11 reuse/duplication policy; LEG12 proofbook workflow.                                                                                                                                                                        |
| Definitions                     | GlobalNoGoGuardrailContract is the top-level invariant set in global_no_go_guardrails. Per-phase no_go_guardrails are local addenda only and cannot weaken the global contract.                                                                                                                                                            |
| Proof target                    | Every phase and workflow record exposes inheritance of the global guardrails before implementation or closeout.                                                                                                                                                                                                                            |
| Proof sketch                    | The YAML master contains a top-level global_no_go_guardrails section, a workflow_policy record for inheritance, a green infrastructure phase 1.1.1.1.0, object LEG13, and a global_no_go_inheritance field in every scratchpad record. The generator validates the section and renders it as a first-class table.                          |
| Verification / audit            | v26 generator validation checks presence of the global section and scratchpad inheritance field. This is planning/documentation infrastructure only; no Lean build is claimed.                                                                                                                                                             |
| Next documentation action       | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty. During each code phase, cite the global guardrail table and record only phase-specific stricter addenda in local no_go_guardrails. |

### Object or quantity LEG14 – Concrete computable instance traversal contract

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Definitions                     | IdealThread route: carrier L = singleton {cell L};<br>CutSpec.full route: carrier L = T.carrier L;<br>string analogy: comparison-only interpretation.                                                                                                                                                               |
| Proof target                    | Planning-level proof that these routes must not be conflated before implementation.                                                                                                                                                                                                                                 |
| Proof sketch                    | The code facts show singleton collapse for IdealThread and full carrier for CutSpec.full. Therefore any nontrivial full-boundary matrix must use full/generated boundary data, not the existing IdealThread carrier, unless a later theorem constructs a lift.                                                      |
| Verification / audit            | Code references checked in repo_snapshot. | Phase                           | 1.1.1.1.0.9                                                                                                                                                                                                                                     |
| Source objects                  | EXEC-2, canonical generator policy, post-97 source audit, CM/j target boundary.                                                                                                                                                                 |
| Definitions                     | The post-97 spiral b-ary tree construction is accepted only as a future test-matrix and comparison profile, never as generator input.                                                                                                           |
| Proof target                    | Show as a planning invariant that future lattice tests must consume code-defined branching and derived CM/j objects rather than defining them.                                                                                                  |
| Proof sketch                    | The decision follows from the existing derived-only and EXEC-2 constraints: angle profiles and complex coordinates are not operational generator data; they can be compared after the finite generator, lattice, and CM/j target objects exist. |
| Verification / audit            | Checked against post #97 content: b-ary addresses, b>=2 heuristic, 120/90 degree profiles, L=3/L=4 closure claims, hierarchical vs spiral distinction. No Lean code changed.                                                                    |

|                           |                                                                                                                                                                                                                                                                                                                            |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Next documentation action | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. When 8.5 starts, fill concrete rows and module manifest; keep all analytic/irrational material in mirror/comparison fields. |

| Documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                                                                        |
| Documented                      | no                                                                                                                                                                                                                                                                   |
| Phase                           | 8.5                                                                                                                                                                                                                                                                  |
| Source objects                  | code-defined static b, L_max, L06, L04, O05, M05; O07 generic finite computation test matrix profile                                                                                                                                                                 |
| Definitions                     | Finite rows for Eisenstein and Gauss test profiles using rational/integer operational invariants.                                                                                                                                                                    |
| Proof target                    | Add static Eisenstein/Gauss sentinel rows to the general O07 test matrix; do not treat them as a complete test suite.                                                                                                                                                |
| Proof sketch                    | Pending. Must use checked finite code/test rows as primary evidence; forum geometry is a heuristic source, not proof.                                                                                                                                                |
| Verification / audit            | Pending. Must check code-defined branching, no duplicate generator logic, EXEC-2 boundary, and no noncomputable leak into operational path. Audit must confirm that special Eisenstein/Gauss rows are sentinels inside generic coverage, not the only passing tests. |

|                           |                                                                                                                    |
|---------------------------|--------------------------------------------------------------------------------------------------------------------|
| Next documentation action | After O07 exists, specify generic row set first, then static sentinel rows and expected mirror/comparison targets. |
|---------------------------|--------------------------------------------------------------------------------------------------------------------|

### Object or quantity L10 – Dynamic branching and L\_max lattice test sweep

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.
