| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.             |
| Source-to-CNNA mapping                | Phase 1.3.3 establishes or neutralizes: Complement families: UV tail; IR/parent-path tail; sideways environment. Object links are generated from the object register.                                   |
| Dependency-depth audit                | Depends on 1.3.2; complement-family source modules. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                        |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                           |

|                                        |                                                                                                                                                                                                                                                                                                      |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Regime/Complement/UVTail.lean;<br>CNNA/PillarA/Regime/Complement/IRTail.lean;<br>CNNA/PillarA/Regime/Complement/SideEnvironment.lean.                                                                                                  |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                    |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                          |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                           |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                          |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                                        |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                               |
| Proof rehearsal before implementation  | Complement families are derived A-internal profiles;<br>they are not exported as direct bright-sector data.                                                                                                                                                                                          |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                                                              |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                                                           |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00;<br>preserve existing computability boundaries.                                                                                                                                                                          |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                  |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                              |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                    |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                 |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                         |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                            |
| Bridge gap status                      | No mathematical bridge expected;<br>missing names/imports must be localized to the natural source/split layer.                                                                                                                                                                                       |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                                                  |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                          |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                                                         |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit;<br>no Lean build evidence has been recorded for this phase.                                                                                                                                                                         |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                                                  |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                       |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                                                           |

Phase 1.4 – Cayley-Dickson structural path neutral reintegration

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                     |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #fff2cc;">W</span>                                                                                                                                                                                                                          |
| Context class                         | LeanRefactorPhase                                                                                                                                                                                                                                                          |
| Phase documentation tier              | F1                                                                                                                                                                                                                                                                         |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                                                                             |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                                         |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                        |
| Implementation status                 | planned-not-active                                                                                                                                                                                                                                                         |
| Preparation status                    | planned-prepared                                                                                                                                                                                                                                                           |
| Phase type                            | refactor                                                                                                                                                                                                                                                                   |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                                    |
| Title / state                         | Cayley-Dickson structural path neutral reintegration                                                                                                                                                                                                                       |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                                |
| Source-to-CNNA mapping                | Phase 1.4 establishes or neutralizes: CD source; star; normSq; product; alternative/norm laws; HurwitzStop. Object links are generated from the object register. Horn/GA profiles are routed through GA0-GA6 comparison objects only, with no generator or handoff rights. |
| Dependency-depth audit                | Depends on 1.1.5; current Cayley-Dickson structural modules; preliminary object IDs CD0-CD7. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                  |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                                              |
| Positive path plan                    | Implement only after dependencies close. Target: CNNA/PillarA/Structural/CayleyDickson/*.lean.                                                                                                                                                                             |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                             |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation.           |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.                                   |

|                                        |                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                      |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                                                           |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                     |
| Proof rehearsal before implementation  | CD remains an A-internal structural consumer/bridge; no unproved identification of R/C/H/O with arithmetic sectors. V1.25 adds Horn/GA material only as downstream target-gate/scratchpad context; it cannot be used as a source object or release proof.                                                               |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                                                                                 |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                                                                                 |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                                                                                |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                     |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                 |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                       |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                    |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                            |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                               |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                                                                                                             |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                   |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                             |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                                                                            |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit; no Lean build evidence has been recorded for this phase.                                                                                                                                                                                               |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                                                                     |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                          |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                                                                              |

### Phase 1.4.1 – Neutralize Cayley-Dickson source profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                           |

| Preparation status                    | planned-prepared                                                                                                                                                                                                                                                 |
| Phase type                            | refactor                                                                                                                                                                                                                                                         |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                          |
| Title / state                         | Neutralize Cayley-Dickson source profile                                                                                                                                                                                                                         |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                      |
| Source-to-CNNA mapping                | Phase 1.4.1 establishes or neutralizes: Cayley-Dickson source. Object links are generated from the object register.                                                                                                                                              |
| Dependency-depth audit                | Depends on 1.4. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                                                                     |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                                    |
| Positive path plan                    | Implement only after dependencies close. Target: CNNA/PillarA/Structural/CayleyDickson/Source.lean.                                                                                                                                                              |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                   |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.                         |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                         |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                    |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                              |
| Proof rehearsal before implementation | Forward the existing CD source through a neutral profile without turning it into an arithmetic generator.                                                                                                                                                        |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Phase 1.4.2 – Neutralize scalar part profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                   |
| Implementation status                  | planned-not-active                                                                                                                                                                                                                                                    |
| Preparation status                     | planned-prepared                                                                                                                                                                                                                                                      |
| Phase type                             | refactor                                                                                                                                                                                                                                                              |
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                               |
| Title / state                          | Neutralize scalar part profile                                                                                                                                                                                                                                        |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                           |
| Source-to-CNNA mapping                 | Phase 1.4.2 establishes or neutralizes: Scalar part. Object links are generated from the object register.                                                                                                                                                             |
| Dependency-depth audit                 | Depends on 1.4.1. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                                                                        |
| Phase split decision                   | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                                         |
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Structural/CayleyDickson/ScalarPart.lean.                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | Scalar part must be downstream of CD source and must not be used as sector ontology.                                                                                                                                                                                  |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                               |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                               |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                              |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                  |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                                                           |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                              |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Phase 1.4.3 – Neutralize Cayley-Dickson star/conjugation profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                 | planned-not-active                                                                                                                                                                             |
| Preparation status                    | planned-prepared                                                                                                                                                                               |
| Phase type                            | refactor                                                                                                                                                                                       |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                        |
| Title / state                         | Neutralize Cayley-Dickson star/conjugation profile                                                                                                                                             |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.    |
| Source-to-CNNA mapping                | Phase 1.4.3 establishes or neutralizes: Cayley-Dickson star/conjugation. Object links are generated from the object register.                                                                  |
| Dependency-depth audit                | Depends on 1.4.1-1.4.2. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                           |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                  |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Structural/CayleyDickson/Star.lean.                                                                                                                                                                     |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | Star/conjugation proof is forwarded structurally; no arithmetic identification is introduced.                                                                                                                                                                         |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                               |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                               |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                              |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                                                           |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                          |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit; no Lean build evidence has been recorded for this phase.                                                                                                                                             |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                   |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                            |
| Source materials / references          | <ul style="list-style-type: none"> <li>CNNA/PillarA/Structural/CayleyDickson/S6CanonicalStar.lean</li> <li>v22 corrected Phase-1 dependency hierarchy</li> </ul>                                                                                                      |

### Phase 1.4.4 – Neutralize CD normSq profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                           |

| Implementation status                 | planned-not-active                                                                                                                                                                                                                                               |
| Preparation status                    | planned-prepared                                                                                                                                                                                                                                                 |
| Phase type                            | refactor                                                                                                                                                                                                                                                         |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                          |
| Title / state                         | Neutralize CD normSq profile                                                                                                                                                                                                                                     |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                      |
| Source-to-CNNA mapping                | Phase 1.4.4 establishes or neutralizes: CD normSq. Object links are generated from the object register.                                                                                                                                                          |
| Dependency-depth audit                | Depends on 1.4.3. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                                                                   |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                                    |
| Positive path plan                    | Implement only after dependencies close. Target: CNNA/PillarA/Structural/CayleyDickson/NormSq.lean.                                                                                                                                                              |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                   |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.                         |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                         |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                    |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                              |
| Proof rehearsal before implementation | NormSq remains a CD structural certificate until a later arithmetic bridge is proved.                                                                                                                                                                            |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Phase 1.4.5 – Neutralize CD product profile

**Table legend.**   = green/closed and derived-only;   = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   = orange/implementable after stated predecessor closure;   = yellow/active and implementable now;   = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                     |

| Phase type                             | refactor                                                                                                                                                                                                                   |
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                    |
| Title / state                          | Neutralize CD product profile                                                                                                                                                                                              |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                |
| Source-to-CNNA mapping                 | Phase 1.4.5 establishes or neutralizes: CD multiplication/product. Object links are generated from the object register.                                                                                                    |
| Dependency-depth audit                 | Depends on 1.4.1;<br>1.4.3. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                   |
| Phase split decision                   | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                              |
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Structural/CayleyDickson/Product.lean.                                                                                                                       |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation  | Product data is re-exposed without changing algebraic semantics.                                                                                                                                                           |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                    |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                    |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                   |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                        |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                    |
| Expected executable witness            | not specified yet                                                                                                                                                                                                          |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                       |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                  |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                        |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Implementation prompt contract       | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| How implemented                      | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Verification / evidence              | Preparation-only evidence from the YAML master and static audit;<br>no Lean build evidence has been recorded for this phase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Post-implementation plan check       | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Artifact packaging rule              | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Implementation notes                 | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Phase 1.4.6 – Neutralize alternative-law certificate

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked

Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                            | refactor                                                                                                                                                                                       |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                        |
| Title / state                         | Neutralize alternative-law certificate                                                                                                                                                         |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                           |
| Source-to-CNNA mapping                 | Phase 1.4.6 establishes or neutralizes: Alternative law. Object links are generated from the object register.                                                                                                                                                         |
| Dependency-depth audit                 | Depends on 1.4.5. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                                                                        |
| Phase split decision                   | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                                         |
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Structural/CayleyDickson/AlternativeLaw.lean.                                                                                                                                                           |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | Forward the certificate only if the exact product/star/norm provenance is visible.                                                                                                                                                                                    |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                               |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                               |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                              |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                                                           |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                          |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit; no Lean build evidence has been recorded for this phase.                                                                                                                                             |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                   |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                            |
| Source materials / references          | <ul style="list-style-type: none"> <li>CNNA/PillarA/Structural/CayleyDickson/S6AlternativeLawScaffold.lean; S6FullAlternativeLawBoundary.lean</li> <li>v22 corrected Phase-1 dependency hierarchy</li> </ul>                                                          |

### Phase 1.4.7 – Neutralize norm-multiplicativity certificate

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                           |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                                                                                                |
| Context class                         | LeanRefactorPhase                                                                                                                                                                                                                                                |
| Phase documentation tier              | F1                                                                                                                                                                                                                                                               |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                                                                   |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                               |

| Preparation status                    | planned-prepared                                                                                                                                                                                                                                                 |
| Phase type                            | refactor                                                                                                                                                                                                                                                         |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                          |
| Title / state                         | Neutralize norm-multiplicativity certificate                                                                                                                                                                                                                     |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                      |
| Source-to-CNNA mapping                | Phase 1.4.7 establishes or neutralizes: Norm multiplicativity. Object links are generated from the object register.                                                                                                                                              |
| Dependency-depth audit                | Depends on 1.4.4; 1.4.5. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                                                            |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                                    |
| Positive path plan                    | Implement only after dependencies close. Target: CNNA/PillarA/Structural/CayleyDickson/NormMultiplicativity.lean.                                                                                                                                                |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                   |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.                         |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                 |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                    |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                              |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof rehearsal before implementation  | Do not use multiplicativity to infer arithmetic sector semantics before CD8.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00;<br>preserve existing computability boundaries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. | Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Phase 1.4.8 – Neutralize Hurwitz-stop/classification boundary

**Table legend.**   = green/closed and derived-only;   = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   = orange/implementable after stated predecessor closure;   = yellow/active and implementable now;   = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                                                     |

| Preparation status                     | planned-prepared                                                                                                                                                                                                                                           |
| Phase type                             | refactor                                                                                                                                                                                                                                                   |
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                    |
| Title / state                          | Neutralize Hurwitz-stop/classification boundary                                                                                                                                                                                                            |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                |
| Source-to-CNNA mapping                 | Phase 1.4.8 establishes or neutralizes: Hurwitz stop / R,C,H,O classification. Object links are generated from the object register. Horn/GA profiles are routed through GA0-GA6 comparison objects only, with no generator or handoff rights.              |
| Dependency-depth audit                 | Depends on 1.4.6;<br>1.4.7. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                                                   |
| Phase split decision                   | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                              |
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Structural/CayleyDickson/HurwitzStop.lean.                                                                                                                                                   |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                 |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                   |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                        |
| Proof rehearsal before implementation  | Classification is a structural boundary result, not a license to identify arithmetic sectors without a later bridge. V1.25 adds Horn/GA material only as downstream target-gate/scratchpad context; it cannot be used as a source object or release proof. |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                    |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                    |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                   |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                        |

### Phase 1.4.9 – Quaternion/geometric-algebra external reference gateway for the Cayley-Dickson structural path

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

|                                        |                                                                                                                                                                                                                           |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation status                     | planned-prepared                                                                                                                                                                                                          |
| Phase type                             | comparison                                                                                                                                                                                                                |
| Phase-type-specific contract           | Comparison/reference phase: records external target criteria and scratchpad information; it cannot supply CNNA premises or release mathematical phases.                                                                   |
| Title / state                          | Quaternion/geometric-algebra external reference gateway for the Cayley-Dickson structural path                                                                                                                            |
| Preparation workflow                   | External-source intake as comparison/reference gate with derived-only boundary.                                                                                                                                           |
| Source-to-CNNA mapping                 | Maps external quaternion/GA facts to target-gate rows GA0-GA3. The mapping is explicitly comparison-only and cannot choose CNNA algebra, orientation or scalar layer.                                                     |
| Dependency-depth audit                 | Depends on CD neutral reintegration 1.4.1-1.4.8 and later CD-derived structure; does not depend on or unlock active pre-code phase 1.1.1.1.5.1.                                                                           |
| Phase split decision                   | Split into narrow comparison gates so CD, Pillar-B boundary algebra, Dirac/STA and side-comparison targets do not collapse into one ambiguous external-theory phase.                                                      |
| Positive path plan                     | Do not implement proof code yet. Keep target invariants in scratchpad; when predecessor data is closed, add a small neutral comparison API and prove/falsify explicitly.                                                  |
| Module implementation manifest         | No Lean modules in V1.25. Future optional modules must be neutral ReferenceGates/ComparisonGate modules, not phase-named public APIs.                                                                                     |
| Semantic placement decision            | Natural placement is comparison/reference-gate layer, not a foundational CNNA derivation layer.                                                                                                                           |
| Reuse and duplication audit            | Reuses existing CD, Pillar-B and side-comparison umbrella phases; new rows are target-gate refinements, not duplicate derivation phases.                                                                                  |
| Canonical generator policy             | The only generator remains the CNNA Lean/provenance chain. External theory may only define target profiles for later comparison.                                                                                          |
| Module compactness rule                | Keep future comparison APIs small and isolated; no broad GA framework should be introduced before a concrete CNNA-derived comparison need exists.                                                                         |
| Refactor regression protocol           | No Lean refactor in V1.25. Future module changes require import graph check, consumer discipline audit and full local Lean build evidence.                                                                                |
| Refactor migration metrics             | No Lean migration. Future comparison module metrics: declarations added, imports added, consumer count, and target/equality proofs closed.                                                                                |
| Lean/mathlib version policy            | Baseline remains pinned Lean/mathlib snapshot; live documentation is only a source-discovery hint until verified locally against the pin.                                                                                 |
| ExecComplex boundary policy            | Do not replace ExecComplex or CNNA scalar provenance with external complex quaternions or analytic Complex.                                                                                                               |
| Consumer-contract direction            | Comparison consumers may read CNNA-derived outputs; CNNA derivation phases may not consume the comparison profile as a generator.                                                                                         |
| Governance-overhead review             | Added overhead is justified because sign, unit and semantic ambiguities are high-risk; gates are narrow to avoid broad external-theory creep.                                                                             |
| Proof rehearsal before implementation  | When CD0-CD7 are closed, instantiate a small comparison profile and check target identities against CD-derived operations. Failure becomes a documented non-match or natural-origin backjump, not a patch.                |
| Expected tactics                       | Future Lean work should use explicit structures, field/projection equalities, constructor-based proofs, local case splits and finite matrix entry proofs; avoid broad simp/simpa collapse and opaque native_decide goals. |
| Expected mathlib imports               | Reference candidates only: Mathlib.Algebra.Quaternion, Mathlib.Analysis.Quaternion, Mathlib.LinearAlgebra.CliffordAlgebra.Basic. Verify against the pinned Lean/mathlib snapshot before any implementation.               |
| ExecComplex/computable plan            | No ExecComplex object introduced. If finite numeric checks are later needed, keep them mirror/diagnostic unless an exact CNNA-derived computable path is proved.                                                          |
| Concrete computable instance traversal | Concrete traversal currently consists of source equation/profile extraction and target-object registration; no CNNA runtime traversal yet.                                                                                |
| Computable path non-skeleton status    | Reference skeleton only. It must not be presented as computable CNNA evidence until future exact instances are constructed.                                                                                               |
| Expected executable witness            | For V1.25: generated TSV/TEX/PDF artifacts. Future Lean witness: explicit comparison structure instantiated from CNNA-derived objects.                                                                                    |
| Mathlib complication log               | Current web docs indicate available Quaternion and CliffordAlgebra APIs, but the project pin is Lean/mathlib 4.28.0; implementation must recheck exact names and theorem availability.                                    |
| Noncomputable boundary audit           | No noncomputable Lean code introduced. Future use of analytic/normed quaternion APIs must be isolated from operational paths unless explicitly allowed.                                                                   |
| Mathlib mitigation/refactor layer      | If mathlib Clifford/Quaternion APIs pull noncomputable/classical pressure, keep them in mirror/comparison modules or define a minimal finite target profile instead.                                                      |
| Bridge gap status                      | Bridge intentionally open. The external reference describes target shapes; CNNA must derive any matching structure internally before comparison.                                                                          |
| Natural backjump/refactor layer        | If the comparison needs missing structure, patch only the earliest natural CNNA layer where that structure is generated, not the comparison/consumer phase.                                                               |
| Implementation prompt contract         | Future implementation prompt must state comparison-only status, predecessor objects, no new generator axioms, no external-theory imports unless pinned and isolated, and exact target equalities/failures.                |
| Global no-go inheritance               | All global no-go guardrails apply, especially derived-only, positive-path-first, patch-at-natural-origin and reference-theory-as-target-only rules.                                                                       |
| How implemented                        | Planned reference/target-gate integration only. V1.25 records source reading, object links, proof-dossier placeholders and scratchpad material; no Lean code is implemented.                                              |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Verification / evidence              | YAML generator validation and generated table/PDF outputs after V1.25 update. No Lean build evidence because no Lean source changed.                                                                                                                                                                                                                                                                           |
| Proof strategy                       | Positive path: wait for the natural CNNA predecessor objects, then encode the smallest comparison profile and prove target equality/failure from CNNA data only.                                                                                                                                                                                                                                               |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                                                                                                              |
| Post-implementation plan check       | After any future comparison implementation, record whether the target matched, failed, or required a natural-origin backjump;<br>do not smooth failure into a weakened claim.                                                                                                                                                                                                                                  |
| Artifact packaging rule              | Package YAML, generated tables, generated PDF and report. Do not package external PDFs as generated project truth unless they are user-uploaded source material.                                                                                                                                                                                                                                               |
| Implementation notes                 | External theory is recorded only as comparison material. It may suggest target invariants, sign audits and future checks, but cannot release phases or provide CNNA generators.                                                                                                                                                                                                                                |

### Phase 1.4.9.1 – Hamilton unit and Pauli/Cartan sign-convention comparison profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                    |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                           | W                                                                                                                                                                                                                         |
| Context class                          | ReferenceGatePhase                                                                                                                                                                                                        |
| Phase documentation tier               | F2                                                                                                                                                                                                                        |
| Phase documentation depth requirement  | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                             |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                        |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                       |
| Implementation status                  | planned-not-active                                                                                                                                                                                                        |
| Preparation status                     | planned-prepared                                                                                                                                                                                                          |
| Phase type                             | comparison                                                                                                                                                                                                                |
| Phase-type-specific contract           | Comparison/reference phase: records external target criteria and scratchpad information; it cannot supply CNNA premises or release mathematical phases.                                                                   |
| Title / state                          | Hamilton unit and Pauli/Cartan sign-convention comparison profile                                                                                                                                                         |
| Preparation workflow                   | External-source intake as comparison/reference gate with derived-only boundary.                                                                                                                                           |
| Source-to-CNNA mapping                 | Records exactly which identities and signs a CNNA-derived quaternion-like candidate must later satisfy; it supplies no candidate itself.                                                                                  |
| Dependency-depth audit                 | Blocked until CD source/product/star/norm profiles have neutral canonical APIs. It is not allowed to precede those derivations.                                                                                           |
| Phase split decision                   | Split into narrow comparison gates so CD, Pillar-B boundary algebra, Dirac/STA and side-comparison targets do not collapse into one ambiguous external-theory phase.                                                      |
| Positive path plan                     | Do not implement proof code yet. Keep target invariants in scratchpad; when predecessor data is closed, add a small neutral comparison API and prove/falsify explicitly.                                                  |
| Module implementation manifest         | No Lean modules in V1.25. Future optional modules must be neutral ReferenceGates/ComparisonGate modules, not phase-named public APIs.                                                                                     |
| Semantic placement decision            | Natural placement is comparison/reference-gate layer, not a foundational CNNA derivation layer.                                                                                                                           |
| Reuse and duplication audit            | Reuses existing CD, Pillar-B and side-comparison umbrella phases; new rows are target-gate refinements, not duplicate derivation phases.                                                                                  |
| Canonical generator policy             | The only generator remains the CNNA Lean/provenance chain. External theory may only define target profiles for later comparison.                                                                                          |
| Module compactness rule                | Keep future comparison APIs small and isolated; no broad GA framework should be introduced before a concrete CNNA-derived comparison need exists.                                                                         |
| Refactor regression protocol           | No Lean refactor in V1.25. Future module changes require import graph check, consumer discipline audit and full local Lean build evidence.                                                                                |
| Refactor migration metrics             | No Lean migration. Future comparison module metrics: declarations added, imports added, consumer count, and target/equality proofs closed.                                                                                |
| Lean/mathlib version policy            | Baseline remains pinned Lean/mathlib snapshot; live documentation is only a source-discovery hint until verified locally against the pin.                                                                                 |
| ExecComplex boundary policy            | Do not replace ExecComplex or CNNA scalar provenance with external complex quaternions or analytic Complex.                                                                                                               |
| Consumer-contract direction            | Comparison consumers may read CNNA-derived outputs; CNNA derivation phases may not consume the comparison profile as a generator.                                                                                         |
| Governance-overhead review             | Added overhead is justified because sign, unit and semantic ambiguities are high-risk; gates are narrow to avoid broad external-theory creep.                                                                             |
| Proof rehearsal before implementation  | Future proof should define a CNNA candidate triple from CD data, then prove/falsify square/product/anti-commutation equalities and record sign convention explicitly.                                                     |
| Expected tactics                       | Future Lean work should use explicit structures, field/projection equalities, constructor-based proofs, local case splits and finite matrix entry proofs; avoid broad simp/simpa collapse and opaque native_decide goals. |
| Expected mathlib imports               | Reference candidates only: Mathlib.Algebra.Quaternion, Mathlib.Analysis.Quaternion, Mathlib.LinearAlgebra.CliffordAlgebra.Basic. Verify against the pinned Lean/mathlib snapshot before any implementation.               |
| ExecComplex/computable plan            | No ExecComplex object introduced. If finite numeric checks are later needed, keep them mirror/diagnostic unless an exact CNNA-derived computable path is proved.                                                          |
| Concrete computable instance traversal | Concrete traversal currently consists of source equation/profile extraction and target-object registration; no CNNA runtime traversal yet.                                                                                |
| Computable path non-skeleton status    | Reference skeleton only. It must not be presented as computable CNNA evidence until future exact instances are constructed.                                                                                               |
| Expected executable witness            | For V1.25: generated TSV/TEX/PDF artifacts. Future Lean witness: explicit comparison structure instantiated from CNNA-derived objects.                                                                                    |
| Mathlib complication log               | Current web docs indicate available Quaternion and CliffordAlgebra APIs, but the project pin is Lean/mathlib 4.28.0; implementation must recheck exact names and theorem availability.                                    |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Noncomputable boundary audit         | No noncomputable Lean code introduced. Future use of analytic/normed quaternion APIs must be isolated from operational paths unless explicitly allowed.                                                                                                                                                                                                                                                        |
| Mathlib mitigation/refactor layer    | If mathlib Clifford/Quaternion APIs pull noncomputable/classical pressure, keep them in mirror/comparison modules or define a minimal finite target profile instead.                                                                                                                                                                                                                                           |
| Bridge gap status                    | Bridge intentionally open. The external reference describes target shapes; CNNA must derive any matching structure internally before comparison.                                                                                                                                                                                                                                                               |
| Natural backjump/refactor layer      | If the comparison needs missing structure, patch only the earliest natural CNNA layer where that structure is generated, not the comparison/consumer phase.                                                                                                                                                                                                                                                    |
| Implementation prompt contract       | Future implementation prompt must state comparison-only status, predecessor objects, no new generator axioms, no external-theory imports unless pinned and isolated, and exact target equalities/failures.                                                                                                                                                                                                     |
| Global no-go inheritance             | All global no-go guardrails apply, especially derived-only, positive-path-first, patch-at-natural-origin and reference-theory-as-target-only rules.                                                                                                                                                                                                                                                            |
| How implemented                      | Planned reference/target-gate integration only. V1.25 records source reading, object links, proof-dossier placeholders and scratchpad material; no Lean code is implemented.                                                                                                                                                                                                                                   |
| Verification / evidence              | YAML generator validation and generated table/PDF outputs after V1.25 update. No Lean build evidence because no Lean source changed.                                                                                                                                                                                                                                                                           |
| Proof strategy                       | Positive path: wait for the natural CNNA predecessor objects, then encode the smallest comparison profile and prove target equality/failure from CNNA data only.                                                                                                                                                                                                                                               |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                                                                                                              |
| Post-implementation plan check       | After any future comparison implementation, record whether the target matched, failed, or required a natural-origin backjump; do not smooth failure into a weakened claim.                                                                                                                                                                                                                                     |
| Artifact packaging rule              | Package YAML, generated tables, generated PDF and report. Do not package external PDFs as generated project truth unless they are user-uploaded source material.                                                                                                                                                                                                                                               |
| Implementation notes                 | External theory is recorded only as comparison material. It may suggest target invariants, sign audits and future checks, but cannot release phases or provide CNNA generators.                                                                                                                                                                                                                                |

| Phase status                           | W                                                                                                                                                                                                                         |
| Context class                          | ReferenceGatePhase                                                                                                                                                                                                        |
| Phase documentation tier               | F2                                                                                                                                                                                                                        |
| Phase documentation depth requirement  | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                             |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                        |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                       |
| Implementation status                  | planned-not-active                                                                                                                                                                                                        |
| Preparation status                     | planned-prepared                                                                                                                                                                                                          |
| Phase type                             | comparison                                                                                                                                                                                                                |
| Phase-type-specific contract           | Comparison/reference phase: records external target criteria and scratchpad information; it cannot supply CNNA premises or release mathematical phases.                                                                   |
| Title / state                          | Bivector/pseudoscalar duality and complex-quaternion multivector comparison profile                                                                                                                                       |
| Preparation workflow                   | External-source intake as comparison/reference gate with derived-only boundary.                                                                                                                                           |
| Source-to-CNNA mapping                 | Maps GA duality to target profiles GA2-GA3. CNNA must derive any orientation, volume element, dimension or scalar-layer candidate first.                                                                                  |
| Dependency-depth audit                 | Depends on 1.4.9.1 and future CNNA-derived orientation/volume candidates. It must not create a complex layer for CD9.                                                                                                     |
| Phase split decision                   | Split into narrow comparison gates so CD, Pillar-B boundary algebra, Dirac/STA and side-comparison targets do not collapse into one ambiguous external-theory phase.                                                      |
| Positive path plan                     | Do not implement proof code yet. Keep target invariants in scratchpad; when predecessor data is closed, add a small neutral comparison API and prove/falsify explicitly.                                                  |
| Module implementation manifest         | No Lean modules in V1.25. Future optional modules must be neutral ReferenceGates/ComparisonGate modules, not phase-named public APIs.                                                                                     |
| Semantic placement decision            | Natural placement is comparison/reference-gate layer, not a foundational CNNA derivation layer.                                                                                                                           |
| Reuse and duplication audit            | Reuses existing CD, Pillar-B and side-comparison umbrella phases; new rows are target-gate refinements, not duplicate derivation phases.                                                                                  |
| Canonical generator policy             | The only generator remains the CNNA Lean/provenance chain. External theory may only define target profiles for later comparison.                                                                                          |
| Module compactness rule                | Keep future comparison APIs small and isolated; no broad GA framework should be introduced before a concrete CNNA-derived comparison need exists.                                                                         |
| Refactor regression protocol           | No Lean refactor in V1.25. Future module changes require import graph check, consumer discipline audit and full local Lean build evidence.                                                                                |
| Refactor migration metrics             | No Lean migration. Future comparison module metrics: declarations added, imports added, consumer count, and target/equality proofs closed.                                                                                |
| Lean/mathlib version policy            | Baseline remains pinned Lean/mathlib snapshot; live documentation is only a source-discovery hint until verified locally against the pin.                                                                                 |
| ExecComplex boundary policy            | Do not replace ExecComplex or CNNA scalar provenance with external complex quaternions or analytic Complex.                                                                                                               |
| Consumer-contract direction            | Comparison consumers may read CNNA-derived outputs; CNNA derivation phases may not consume the comparison profile as a generator.                                                                                         |
| Governance-overhead review             | Added overhead is justified because sign, unit and semantic ambiguities are high-risk; gates are narrow to avoid broad external-theory creep.                                                                             |
| Proof rehearsal before implementation  | Future proof should start from a CNNA-derived pseudoscalar/volume candidate, then check square, commutation and dual-pairing identities. For biquaternions, compare only after CD9 noncircularity is settled.             |
| Expected tactics                       | Future Lean work should use explicit structures, field/projection equalities, constructor-based proofs, local case splits and finite matrix entry proofs; avoid broad simp/simpa collapse and opaque native_decide goals. |
| Expected mathlib imports               | Reference candidates only: Mathlib.Algebra.Quaternion, Mathlib.Analysis.Quaternion, Mathlib.LinearAlgebra.CliffordAlgebra.Basic. Verify against the pinned Lean/mathlib snapshot before any implementation.               |
| ExecComplex/computable plan            | No ExecComplex object introduced. If finite numeric checks are later needed, keep them mirror/diagnostic unless an exact CNNA-derived computable path is proved.                                                          |
| Concrete computable instance traversal | Concrete traversal currently consists of source equation/profile extraction and target-object registration; no CNNA runtime traversal yet.                                                                                |
| Computable path non-skeleton status    | Reference skeleton only. It must not be presented as computable CNNA evidence until future exact instances are constructed.                                                                                               |
| Expected executable witness            | For V1.25: generated TSV/TEX/PDF artifacts. Future Lean witness: explicit comparison structure instantiated from CNNA-derived objects.                                                                                    |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mathlib complication log             | Current web docs indicate available Quaternion and CliffordAlgebra APIs, but the project pin is Lean/mathlib 4.28.0; implementation must recheck exact names and theorem availability.                                                                                                                                                                                                                         |
| Noncomputable boundary audit         | No noncomputable Lean code introduced. Future use of analytic/normed quaternion APIs must be isolated from operational paths unless explicitly allowed.                                                                                                                                                                                                                                                        |
| Mathlib mitigation/refactor layer    | If mathlib Clifford/Quaternion APIs pull noncomputable/classical pressure, keep them in mirror/comparison modules or define a minimal finite target profile instead.                                                                                                                                                                                                                                           |
| Bridge gap status                    | Bridge intentionally open. The external reference describes target shapes; CNNA must derive any matching structure internally before comparison.                                                                                                                                                                                                                                                               |
| Natural backjump/refactor layer      | If the comparison needs missing structure, patch only the earliest natural CNNA layer where that structure is generated, not the comparison/consumer phase.                                                                                                                                                                                                                                                    |
| Implementation prompt contract       | Future implementation prompt must state comparison-only status, predecessor objects, no new generator axioms, no external-theory imports unless pinned and isolated, and exact target equalities/failures.                                                                                                                                                                                                     |
| Global no-go inheritance             | All global no-go guardrails apply, especially derived-only, positive-path-first, patch-at-natural-origin and reference-theory-as-target-only rules.                                                                                                                                                                                                                                                            |
| How implemented                      | Planned reference/target-gate integration only. V1.25 records source reading, object links, proof-dossier placeholders and scratchpad material; no Lean code is implemented.                                                                                                                                                                                                                                   |
| Verification / evidence              | YAML generator validation and generated table/PDF outputs after V1.25 update. No Lean build evidence because no Lean source changed.                                                                                                                                                                                                                                                                           |
| Proof strategy                       | Positive path: wait for the natural CNNA predecessor objects, then encode the smallest comparison profile and prove target equality/failure from CNNA data only.                                                                                                                                                                                                                                               |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                                                                                                              |
| Post-implementation plan check       | After any future comparison implementation, record whether the target matched, failed, or required a natural-origin backjump; do not smooth failure into a weakened claim.                                                                                                                                                                                                                                     |
| Artifact packaging rule              | Package YAML, generated tables, generated PDF and report. Do not package external PDFs as generated project truth unless they are user-uploaded source material.                                                                                                                                                                                                                                               |
| Implementation notes                 | External theory is recorded only as comparison material. It may suggest target invariants, sign audits and future checks, but cannot release phases or provide CNNA generators.                                                                                                                                                                                                                                |

| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                 |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Dependency-depth audit                | Pending. Must be completed before this phase may become active.                                                                                                                                                         |
| Proof rehearsal before implementation | Pending. Must be written before implementation starts.                                                                                                                                                                  |
| Bridge gap status                     | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                   |

### Phase 3.0 – Boundary-source route separation: full-cut matrix geometry versus IdealThread scalar collapse

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                                                                                                                                  |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                                                                                              |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                                                                             |
| Implementation status                 | planned-not-active                                                                                                                                                                                                                                                                                                              |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                    |
| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                      |
| Phase-type-specific contract          | Refactor/derivation-preparation phase: record module/declaration migration metrics, import delta, consumer audit, and concrete route witness before implementation.                                                                                                                                                             |
| Title / state                         | Thread-recursion arithmetic-shadow audit before operational arithmetic wrappers                                                                                                                                                                                                                                                 |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                         |
| Source-to-CNNA mapping                | Not prepared yet;<br>when activated, map only code-backed route facts and mark analogies comparison-only.                                                                                                                                                                                                                       |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must include route-dependency audit and module placement check before activation.                                                                                   |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                               |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Trace scalar recurrence provenance before interpreting arithmetic outputs. Keep D=-3/-4/CM claims on operational discriminant/number-theory route, not on analogy. |
| Module implementation manifest        | Candidate: CNNA/PillarA/Operational/ThreadRecursionAudit.lean after checking if existing Schur modules can host the audit compactly.                                                                                                                                                                                            |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                               |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                     |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                      |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                     |
| Consumer-contract direction           | Route direction must be explicit before implementation: thread/full profiles feed Schur/arithmetic audits;<br>analogy/diagnostics never feed generator code.                                                                                                                                                                    |
| Governance-overhead review            | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                          |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Follow recurrenceLedger.recursiveSource fields to boundaryMatrixAt or generated source;<br>prove route classification before arithmetic promotion. Concrete witness required for a finite level/history.                                               |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                                                                 |

### Phase 4.0.1 – General finite computation test matrix before operational arithmetic wrappers

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                              |
| Phase-type-specific contract           | Derivation/test phase: proof-carrying computation rows required before object promotion.                                                                                                                                                                                                                                                                                |
| Title / state                          | General finite computation test matrix before operational arithmetic wrappers                                                                                                                                                                                                                                                                                           |
| Preparation workflow                   | General finite computation-test workflow after Phase 4.0 audit.                                                                                                                                                                                                                                                                                                         |
| Source-to-CNNA mapping                 | Generic rows map to O07. Eisenstein/Gauss rows map later to L09/M08/BR10 only as sentinels and comparison checks.                                                                                                                                                                                                                                                       |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Not active until 4.0 closes. It may consume Phase-3 boundary profiles and generator outputs but must not reconstruct earlier Schur/DtN logic.                                                                        |
| Phase split decision                   | Inserted between arithmetic-shadow audit and operational wrappers so the first calculations are tested generally before special comparison interpretation.                                                                                                                                                                                                              |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Start with small finite code-defined cases across L_max and branch-mode, then enlarge coverage. Keep sentinel rows separate from generic coverage.                                                         |
| Module implementation manifest         | Candidate: CNNA/PillarA/Operational/ThreadRecursionAudit.lean after checking if existing Schur modules can host the audit compactly.                                                                                                                                                                                                                                    |
| Refactor regression protocol           | The test harness later serves as regression sentinel for wrapper migrations.                                                                                                                                                                                                                                                                                            |
| Refactor migration metrics             | not applicable until implementation.                                                                                                                                                                                                                                                                                                                                    |
| Lean/mathlib version policy            | Use frozen baseline unless a phase-boundary upgrade gate is opened.                                                                                                                                                                                                                                                                                                     |
| ExecComplex boundary policy            | EXEC-2 binding.                                                                                                                                                                                                                                                                                                                                                         |
| Consumer-contract direction            | Consumes generator/Phase-3 profiles;<br>does not define them.                                                                                                                                                                                                                                                                                                           |
| Governance-overhead review             | Review after first implementation whether generic test obligation caught issues.                                                                                                                                                                                                                                                                                        |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Each row should state input provenance, generated finite carrier/matrix/profile, executable output, and verification status. A generic-row failure blocks;<br>a sentinel mismatch becomes a comparison/failure ledger entry. |
| Expected tactics                       | Explicit constructors, finite records, direct projections, small arithmetic certificates;<br>avoid fragile rewrite-only proofs.                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Likely existing finite/matrix/arithmetic imports;<br>any polynomial/matrix API noncomputability must be logged.                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Only rational/integer/finite fields operational. Non-rational geometry fields are mirror-only and optional.                                                                                                                                                                                                                                                             |
| Concrete computable instance traversal | Required: at least one generic finite row family traverses the actual computation path;<br>special sentinels cannot be the only traversal.                                                                                                                                                                                                                              |
| Computable path non-skeleton status    | planned: non-skeleton status requires generated finite input plus executable output record.                                                                                                                                                                                                                                                                             |
| Expected executable witness            | O07 row output record with finite/rational/integer fields and proof/status evidence.                                                                                                                                                                                                                                                                                    |
| Mathlib complication log               | to be filled before implementation;<br>include noncomputable risks for matrix/polynomial APIs.                                                                                                                                                                                                                                                                          |
| Noncomputable boundary audit           | No operational row may require noncomputable data. Mirror comparison columns are isolated.                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | Use explicit finite constructors;<br>if mathlib API is noncomputable, introduce an operational substitute or mirror-only column.                                                                                                                                                                                                                                        |
| Bridge gap status                      | Provides the general testing bridge missing from v32 before the specialized lattice test matrix.                                                                                                                                                                                                                                                                        |
| Natural backjump/refactor layer        | If row generation needs duplicate tree/generator code, refactor the canonical generator rather than adding local test logic.                                                                                                                                                                                                                                            |
| Implementation prompt contract         | Specify exact module count/name, input row schema, generic coverage, sentinel rows, and expected executable witness before code is written.                                                                                                                                                                                                                             |

| Title / state                         | Regime-typed finite computation test matrix                                                                                                                                                                                                                                                    |
| Preparation workflow                  | regime-typed general early finite computation test workflow                                                                                                                                                                                                                                    |
| Source-to-CNNA mapping                | Eisenstein/Gauss map to closed-root sentinel candidates only after noOuter/empty-set REAL-root route exists. Other Heegner or CM targets map to complement-projection/comparison rows unless a noOuter derivation is separately proven.                                                        |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. No early mathematics consumes the classification as an input. It is a test/reporting schema before implementation and a proof target later. |
| Phase split decision                  | split from v33 O07 because generic-vs-sentinel is not enough;<br>regime typing is a separate semantic axis.                                                                                                                                                                                    |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. First run generic finite rows;<br>then annotate rows by derived regime;<br>then interpret Eisenstein/Gauss as noOuter-root sentinels and all other Heegner/CM rows as projections/comparison until proven otherwise. |

### Phase 4.0.3 – Scalar-layer computation test rows: ExecComplex vs exact quadratic extension boundary

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
 Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Title / state                          | Scalar-layer computation test rows: ExecComplex vs exact quadratic extension boundary                                                                                                                                                                                                                              |
| Preparation workflow                   | computable scalar architecture workflow                                                                                                                                                                                                                                                                            |
| Source-to-CNNA mapping                 | Finite row schema maps outputs into rational/integer invariants for operational closure.                                                                                                                                                                                                                           |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Scalar architecture decisions must precede code implementation. Exact quadratic or CD scalar routes may not feed earlier generator definitions.                 |
| Phase split decision                   | split out because ExecComplex limits affect Phase 1.2, 4, 5, 7, 8 and CD bridges differently.                                                                                                                                                                                                                      |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Keep current QxQ path first; add exact quadratic pilot only if needed by finite tests and no duplicate module exists; keep analytic Complex mirror-only. |
| Module implementation manifest         | pending Phase 1.1.1.1.1                                                                                                                                                                                                                                                                                            |
| Semantic placement decision            | scalar-foundation / bridge governance, not generator semantics                                                                                                                                                                                                                                                     |
| Reuse and duplication audit            | must check existing ExecComplex, ExecComplexBridge, Schur.CharpolyC, ArithmeticCDBridge, and mathlib QuadraticAlgebra before proposing new module                                                                                                                                                                  |
| Canonical generator policy             | scalar layer must consume canonical generator outputs only; cannot define generator semantics                                                                                                                                                                                                                      |
| Module compactness rule                | do not create ExactQuadraticComplex unless existing foundation/bridge modules cannot carry the semantics cleanly                                                                                                                                                                                                   |
| Refactor regression protocol           | incremental wrapper mode; full local build green after each migration step                                                                                                                                                                                                                                         |
| Refactor migration metrics             | track declarations migrated, imports changed, executable witnesses added                                                                                                                                                                                                                                           |
| Lean/mathlib version policy            | 4.28.0 baseline unless version gate explicitly opens upgrade                                                                                                                                                                                                                                                       |
| ExecComplex boundary policy            | QxQ rational floor; exact quadratic coordinates require O09 plus O10/BR14 proof-carrying D-source; no free sqrt(D).                                                                                                                                                                                                |
| Consumer-contract direction            | scalar layer consumes generator/arithmetic source data; generator definitions do not consume scalar comparison/mirror data                                                                                                                                                                                         |
| Governance-overhead review             | review after first scalar/module manifest whether this lock forced a concrete decision.                                                                                                                                                                                                                            |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Run generic rows first; sentinel rows second; compare QxQ-only closure with O09 exact quadratic closure.                                                                |
| Expected tactics                       | explicit structures, constructor/projection lemmas, ring-normal-form only for coordinate arithmetic, no Matrix.inv and no consumer-side patch.                                                                                                                                                                     |
| Expected mathlib imports               | Mathlib.Algebra.QuadraticAlgebra only if pilot approved; Mathlib.Data.Complex.Basic remains bridge/mirror-only; NumberField modules require version-policy gate.                                                                                                                                                   |
| ExecComplex/computable plan            | Operational outputs must remain executable and project back to allowed invariants.                                                                                                                                                                                                                                 |
| Concrete computable instance traversal | required later: QxQ baseline row, Q(i) row, Q(sqrt(-3)) row, and at least one generic D row if O09 is implemented                                                                                                                                                                                                  |
| Computable path non-skeleton status    | must be shown by concrete row witnesses                                                                                                                                                                                                                                                                            |
| Expected executable witness            | finite row with rational ExecComplex output plus optional exact quadratic coordinate and rational/integer invariant projection                                                                                                                                                                                     |
| Mathlib complication log               | Record Complex/Real noncomputable boundary, QuadraticAlgebra instance diamond warning, NumberField formal/non-executable dependency, and any required version-gate.                                                                                                                                                |
| Noncomputable boundary audit           | General C/R and algebraic closure remain mirror/formal. Exact quadratic candidate must avoid noncomputable definitions on operational path. Exact quadratic use must avoid analytic sqrt/Complex and cite D-source ledger.                                                                                         |
| Mathlib mitigation/refactor layer      | Use project-owned explicit Q-coordinate structure or narrowly wrapped QuadraticAlgebra; isolate formal mathlib NumberField in mirror/proof layer.                                                                                                                                                                  |
| Bridge gap status                      | O09/BR13 open.                                                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | If exact quadratic data are needed, backjump to scalar-foundation layer rather than patching arithmetic/lattice consumers.                                                                                                                                                                                         |
| Implementation prompt contract         | Before Lean code, module manifest must state exact module placement, imported mathlib modules, and why no existing module owns the semantics.                                                                                                                                                                      |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                           |
| How implemented                        | Not implemented.                                                                                                                                                                                                                                                                                                   |

|                                      |                                                                                                                                                                                                                                               |

| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                 |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Dependency-depth audit                | Pending. Must be completed before this phase may become active.                                                                                                                                                         |
| Proof rehearsal before implementation | Pending. Must be written before implementation starts.                                                                                                                                                                  |
| Bridge gap status                     | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                   |

Phase 4.5.1 – Proof-carrying discriminant-to-exact-quadratic instantiation gate

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Title / state                          | Proof-carrying discriminant-to-exact-quadratic instantiation gate                                                                                                                                                                                                                                                                    |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                              |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                                                                                    |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Not before O05/O06 or equivalent operational discriminant ledger is semantically corrected/public enough for consumption. Must consume O09 schema but not define the schema here. |
| Phase split decision                   | No split decided yet.                                                                                                                                                                                                                                                                                                                |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Use the D ledger as sole input, instantiate exact quadratic algebra, prove projection lemmas. If D-source is missing, jump back to discriminant phase.                     |
| Refactor regression protocol           | Apply global refactor regression protocol if code changes.                                                                                                                                                                                                                                                                           |
| Refactor migration metrics             | Pending or not applicable.                                                                                                                                                                                                                                                                                                           |
| Lean/mathlib version policy            | Use frozen Lean/mathlib baseline unless a phase-boundary upgrade gate is opened.                                                                                                                                                                                                                                                     |
| ExecComplex boundary policy            | ExecComplex remains Q x Q; exact quadratic algebraic data require a proof-carrying discriminant source.                                                                                                                                                                                                                              |
| Consumer-contract direction            | No consumer-side patch; missing D-source belongs earlier.                                                                                                                                                                                                                                                                            |
| Governance-overhead review             | Pending or not applicable.                                                                                                                                                                                                                                                                                                           |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Construct instance parameterized by ledger.D. Prove theta-square relation by definition/projection, then norm/trace/conjugation formulas by coordinate calculation.                       |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                    |
| Expected mathlib imports               | Same as O09 if used; avoid new NumberField/Complex imports unless mirror-only and gated by version policy.                                                                                                                                                                                                                           |
| ExecComplex/computable plan            | Input D and output invariant projections are operational/rational/integer; exact quadratic coordinates remain in O09/O10 layer and do not rewrite ExecComplex.                                                                                                                                                                       |
| Concrete computable instance traversal | At minimum: one generic D-ledger row and the Eisenstein/Gauss sentinel D rows when/if the operational path derives their D. Every row must cite its ledger source.                                                                                                                                                                   |
| Computable path non-skeleton status    | not prepared                                                                                                                                                                                                                                                                                                                         |
| Expected executable witness            | Not prepared yet.                                                                                                                                                                                                                                                                                                                    |
| Mathlib complication log               | Record any need for QuadraticAlgebra lemmas versus project-owned coordinate lemmas; no noncomputable quotient/field instances on operational path.                                                                                                                                                                                   |
| Noncomputable boundary audit           | If instantiation requires noncomputable mathlib structure, split mirror proof from executable coordinate witness.                                                                                                                                                                                                                    |
| Mathlib mitigation/refactor layer      | Pending.                                                                                                                                                                                                                                                                                                                             |
| Bridge gap status                      | Open until O05 is corrected and O09 schema exists; this phase may reveal earlier D-source corrections.                                                                                                                                                                                                                               |
| Natural backjump/refactor layer        | Pending.                                                                                                                                                                                                                                                                                                                             |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                |

|                                      |                                                                                                                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                    |
| How implemented                      | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                              |
| Verification / evidence              | Not applicable yet.                                                                                                                                                                                            |
| Post-implementation plan check       | Pending.                                                                                                                                                                                                       |
| Artifact packaging rule              | Return a full zip;<br>do not claim Lean build unless executed or explicitly user-reported green.                                                                                                               |
| Implementation notes                 | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                 |

Phase 4.6 – Comparison target policy

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                  |

| Preparation status                    | not-prepared                                                                                                                                                                                                            |
| Phase type                            | comparison                                                                                                                                                                                                              |
| Phase-type-specific contract          | Comparison/secondary phase: record derived-only boundary and prevent comparison targets from becoming CNNA-generative inputs.                                                                                           |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Dependency-depth audit                | Pending. Must be completed before this phase may become active.                                                                                                                                                         |
| Proof rehearsal before implementation | Pending. Must be written before implementation starts.                                                                                                                                                                  |
| Bridge gap status                     | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                   |

Phase 5 – Number-theory base from operational discriminant: D\_fund, conductor, quadratic field/order, basis, trace/norm/conjugation

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |

| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                                                                                                                   |
| Title / state                          | Number-theory base from operational discriminant: D_fund, conductor, quadratic field/order, basis, trace/norm/conjugation                                                                                                                                                                                                                                 |
| Preparation workflow                   | number-theory base derivation workflow                                                                                                                                                                                                                                                                                                                    |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                     |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |

| Phase documentation depth requirement  | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                                                                                                                                                            |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                                                                                                                                                        |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                                                                                                       |
| Implementation status                  | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Fundamental discriminant and conductor normalization from D_op                                                                                                                                                                                                                                                                                            |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                  |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                                                                                                      |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |

|                                   |                                                                                                                                                                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mathlib complication log          | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit      | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                 | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract    | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance          | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                   | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence           | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check    | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule           | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes              | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                  | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 5.2 – Quadratic field profile from proof-carrying discriminant

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                                                                    |

| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                         | Quadratic field profile from proof-carrying discriminant                                                                                                                                                                                                                                                                                                  |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ExecComplex boundary policy            | QxQ rational floor;<br>exact quadratic coordinates require O09 plus O10/BR14 proof-carrying D-source;<br>no free sqrt(D).                                                                                                                                             |

| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet. Exact quadratic use must avoid analytic sqrt/Complex and cite D-source ledger.                                                                                                                           |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited;<br/>additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                         |

### Phase 5.3 – Quadratic order profile from D\_fund and conductor

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |

| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Quadratic order profile from D_fund and conductor                                                                                                                                                                                                                                                                                                         |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                               |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                     |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                               |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                                                                                                         |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                                                                                                       |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                                                                                                        |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.                                                                                         |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                                                                                                            |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited;<br/>additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                                                                                                             |

Phase 5.4 – Integral basis / omega\_D profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                                                                                                                                                    |

| Phase documentation tier               | F1                                                                                                                                                                                                                                                                                                                                                        |
| Phase documentation depth requirement  | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                                                                                                                                                            |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                                                                                                                                                        |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                                                                                                       |
| Implementation status                  | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Integral basis / omega_D profile                                                                                                                                                                                                                                                                                                                          |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                  |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                                                                                                      |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |

|                                |                                                                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Implementation prompt contract | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance       | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence        | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule        | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes           | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails               | <ul style="list-style-type: none"><li>Global no-go inherited;<br/>additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li></ul>                                                           |

Phase 5.5 – Trace, norm and conjugation forms

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                                                                    |

| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                                                                                                       |
| Implementation status                 | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                         | Trace, norm and conjugation forms                                                                                                                                                                                                                                                                                                                         |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                  |
| Consumer-contract direction           | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 6 – Units, class group, ideals, class number, prime splitting and character from the quadratic order

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                  |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #f4cccc;">R</span>                                                                                                                                                                       |
| Context class                         | LeanDerivationPhase                                                                                                                                                                                                     |
| Phase documentation tier              | F2                                                                                                                                                                                                                      |
| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                           |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                      |

| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                            |
| Phase type                            | derivation                                                                                                                                                                                                              |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                               |
| Title / state                         | Units, class group, ideals, class number, prime splitting and character from the quadratic order                                                                                                                        |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                        |

|                                        |                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                  |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |

| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Unit group of the quadratic order                                                                                                                                                                                                                                                                                                                         |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                     |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                     |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                               |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                                                                                                         |

|                                |                                                                                                                                                                                                                                                                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Verification / evidence        | Not applicable yet.                                                                                                                                                                                                                                            |
| Post-implementation plan check | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                             |
| Artifact packaging rule        | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required. |
| Implementation notes           | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                 |
| No-go guardrails               | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                      |

### Phase 6.2 – Class group, class number and ideal profiles

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                                                                    |

| Phase documentation tier              | F2                                                                                                                                                                                                                                                                                                                                                        |
| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                                                                                                                                                             |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                                                                                                                        |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                                                                                                       |
| Implementation status                 | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                         | Class group, class number and ideal profiles                                                                                                                                                                                                                                                                                                              |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                  |
| Consumer-contract direction           | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all <code>global_no_go_guardrails</code> inherited (GNG01-GNG24)                                                                                                                                                                                              |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 6.2.1 – Fractional and integral ideal profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                 | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                         | Fractional and integral ideal profile                                                                                                                                                                                                                                                                                                                     |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                              |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                 |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 6.2.2 – Principal ideal predicate

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                        |

| Implementation status                  | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Principal ideal predicate                                                                                                                                                                                                                                                                                                                                 |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                     |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |

Phase 6.3 – Heegner/PID/UFD indicator after class-number data

**Table legend.**   G = green/closed and derived-only;   W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   O = orange/implementable after stated predecessor closure;   Y = yellow/active and implementable now;   R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Heegner/PID/UFD indicator after class-number data                                                                                                                                                                                                                                                                                                         |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                  |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                                                                                                      |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |

|                                   |                                                                                                                                                                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Noncomputable boundary audit      | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                 | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract    | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance          | yes;<br>all <code>global_no_go_guardrails</code> inherited (GNG01-GNG24)                                                                                                                                                                                              |
| How implemented                   | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence           | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check    | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule           | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes              | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                  | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 6.4 – Prime splitting and Kronecker/Dirichlet character

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                                                                    |

| Implementation status                 | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                                                                                                                   |
| Title / state                         | Prime splitting and Kronecker/Dirichlet character                                                                                                                                                                                                                                                                                                         |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                            |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation.                                                                                          |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                        |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                           |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |

| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 6.5 – Arithmetic-CD compatibility source-site audit and bridge-precondition register, not final compatibility theorem

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                            | derivation                                                                                                                                                                                     |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.      |

|                                        |                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title / state                          | Arithmetic-CD compatibility source-site audit and bridge-precondition register, not final compatibility theorem                                                                                                                                                                                                                                           |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                               |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Audit source sites for CD norm and arithmetic norm data. Do not prove compatibility here;<br>record missing dependencies and route them to BR08/10.4.2.                                                        |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Final compatibility bridge moved to BR08/CD8 in phases 10.4.1/10.4.2.                                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                     |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                               |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                                                                                                         |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                                                                                                       |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                                                                                                        |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.                                                                                         |
| Implementation notes                   | This phase is no longer the final Arithmetic-CD compatibility theorem. It only registers source sites and preconditions for CD8, whose final proof is deferred to 10.4.2 after BR08.                                                                                                                                                                      |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited;<br/>additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                                                                                                             |

Phase 7 – CM lattice geometry from the quadratic order and exact quadratic coordinates

**Table legend.**   = green/closed and derived-only;   = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   = orange/implementable after stated predecessor closure;   = yellow/active and implementable now;   = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                                                                                                                                                    |

| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                                                                                                                   |
| Title / state                          | CM lattice geometry from the quadratic order and exact quadratic coordinates                                                                                                                                                                                                                                                                              |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | EXEC-2 likely relevant: algebraic irrational geometry/spectral/modular values are mirror-only unless a rational/integer invariant is separately proved for operational return.                                                                                                                                                                            |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |

| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |

|                                |                                                                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Implementation prompt contract | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance       | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence        | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule        | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes           | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails               | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 7.1 – CM embedding and lattice basis

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                         | CM embedding and lattice basis                                                                                                                                                                                                                                                                                                                            |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy           | EXEC-2 likely relevant: algebraic irrational geometry/spectral/modular values are mirror-only unless a rational/integer invariant is separately proved for operational return.                                                                                                                                                                            |
| Consumer-contract direction           | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 7.2 – Gram matrix, determinant and covolume

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                  |

| Phase type                            | derivation                                                                                                                                                                                                              |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                               |
| Title / state                         | Gram matrix, determinant and covolume                                                                                                                                                                                   |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                        |

|                                        |                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | EXEC-2 likely relevant: algebraic irrational geometry/spectral/modular values are mirror-only unless a rational/integer invariant is separately proved for operational return.                                                                                                                                                                            |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                     |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                               |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                                                                                                         |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                                                                                                       |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                                                                                                        |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                            |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                                                                                                            |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                                                                                                                 |

### Phase 7.2.1 – Heegner/class-number-one regime classification after class-number data

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

### Phase 7.3 – Period ratio tau and upper-half-plane condition

**Table legend.**   = green/closed and derived-only;   = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   = orange/implementable after stated predecessor closure;   = yellow/active and implementable now;   = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | EXEC-2 likely relevant: algebraic irrational geometry/spectral/modular values are mirror-only unless a rational/integer invariant is separately proved for operational return.                                                                                                                                                                            |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                                                                                                      |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |

|                                   |                                                                                                                                                                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Noncomputable boundary audit      | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                 | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract    | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance          | yes;<br>all <code>global_no_go_guardrails</code> inherited (GNG01-GNG24)                                                                                                                                                                                              |
| How implemented                   | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence           | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check    | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule           | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes              | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                  | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 7.4 – Angle / cosine profile

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                                                                    |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                         | Angle / cosine profile                                                                                                                                                                                                                                                                                                                                    |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                            |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy_coexistence</code> status before implementation.                                                                                          |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy           | EXEC-2 likely relevant: algebraic irrational geometry/spectral/modular values are mirror-only unless a rational/integer invariant is separately proved for operational return.                                                                                                                                                                            |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                           |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited;<br/>additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                         |

### Phase 7.5 – Lattice automorphism group

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                    |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Context class                         | LeanDerivationPhase                                                                                                                                                                       |
| Phase documentation tier              | F2                                                                                                                                                                                        |
| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.             |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                        |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                       |
| Implementation status                 | planned-not-active                                                                                                                                                                        |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                              |
| Phase type                            | derivation                                                                                                                                                                                |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational. |

|                                        |                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title / state                          | Lattice automorphism group                                                                                                                                                                                                                                                                                                                                |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | EXEC-2 likely relevant: algebraic irrational geometry/spectral/modular values are mirror-only unless a rational/integer invariant is separately proved for operational return.                                                                                                                                                                            |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                                                                                                      |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                     |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                  |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                                                                                                         |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                                                                                                       |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                                                                                                        |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                            |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                                                                                                            |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                                                                                                                 |

### Phase 8 – Modular forms, CM j-invariant targets, and heuristic lattice test matrix

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                                                                                                                                                    |

| Phase documentation tier               | F2                                                                                                                                                                                                                                                                                                                                                        |
| Phase documentation depth requirement  | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                                                                                                                                                             |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                                                                                                                                                        |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                                                                                                       |
| Implementation status                  | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Modular forms, CM j-invariant targets, and heuristic lattice test matrix                                                                                                                                                                                                                                                                                  |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | EXEC-2 likely relevant: algebraic irrational geometry/spectral/modular values are mirror-only unless a rational/integer invariant is separately proved for operational return.                                                                                                                                                                            |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                     |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                               |

|                                |                                                                                                                                                                                                                                                                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| How implemented                | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                              |
| Verification / evidence        | Not applicable yet.                                                                                                                                                                                                                                            |
| Post-implementation plan check | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                             |
| Artifact packaging rule        | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required. |
| Implementation notes           | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                 |
| No-go guardrails               | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                      |

### Phase 8.0 – Modular coordinate prerequisites: SL2Z action and fundamental-domain representative

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation workflow                  | phase dependency bifurcation and semantic placement workflow                                                                                                                                                                                                                                                                                              |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Split because phase 9 mixed modular and physical consumers and phase 10 mixed modular, spectral, transfer, analytic and bridge targets.                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Keep parallel paths after Phase 4; close each path on its own proof-carrying prerequisites.                                                                                                     |
| Module implementation manifest        | No Lean implementation manifest was required when this already-closed/planned infrastructure row was created; under closed LEG10, any future code change touching this phase must fill exact added/modified modules before edits.                                                                                                                         |
| Semantic placement decision           | Existing placement remains historical/planning-only. Future module placement must be revalidated by LEG10 before code changes.                                                                                                                                                                                                                            |
| Reuse and duplication audit           | Not a generator implementation. If later code resembles an existing generator/API, consume LEG11 before edits.                                                                                                                                                                                                                                            |
| Canonical generator policy            | No generator-like code in this record. Future generator-like extensions must route through LEG11.                                                                                                                                                                                                                                                         |
| Module compactness rule               | No one-phase-one-file inference; future modules require semantic/API/import-boundary justification.                                                                                                                                                                                                                                                       |
| Refactor regression protocol          | incremental wrapper mode; full local build green after each migration step                                                                                                                                                                                                                                                                                |
| Refactor migration metrics            | track object reassignments, phase dependency changes, and consumer-path imports                                                                                                                                                                                                                                                                           |
| Lean/mathlib version policy           | 4.28.0 baseline unless version gate explicitly opens upgrade                                                                                                                                                                                                                                                                                              |
| ExecComplex boundary policy           | Phase 4.1 finite matrix is enough for spectral/physical finite consumers; modular/CM analytics remain separate.                                                                                                                                                                                                                                           |

|                                        |                                                                                                                                                                                                                                                               |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                   |
| Governance-overhead review             | Review after first Phase 10 finite consumer whether the bifurcation prevented a false wait on Phase 8/9.                                                                                                                                                      |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. For each object, list minimal existing sources and reject any extra phase dependency not used by the proof target. |
| Expected tactics                       | planning/generator validation now;<br>later Lean proofs use constructor/projection lemmas over source objects only.                                                                                                                                           |
| Expected mathlib imports               | none for planning lock                                                                                                                                                                                                                                        |
| ExecComplex/computable plan            | Spectral/physical finite profiles consume Phase 4.1 ExecBoundaryMatrix;<br>modular forms/CM consume lattice/number-theory path separately.                                                                                                                    |
| Concrete computable instance traversal | Future finite test rows must run separately for arithmetic/modular and spectral/physical consumers.                                                                                                                                                           |
| Computable path non-skeleton status    | Must be demonstrated by finite rows over Phase 4.1 matrix for spectral/physical path and by D/CM rows for modular path.                                                                                                                                       |
| Expected executable witness            | At least one finite ExecBoundaryMatrix spectral profile row and at least one D-to-modular comparison row when those phases activate.                                                                                                                          |
| Mathlib complication log               | Record if modular-form/mathlib APIs are attempted in spectral/physical path;<br>that is a placement smell unless explicitly justified.                                                                                                                        |
| Noncomputable boundary audit           | Analytic modular/j/L-function objects remain mirror/comparison and cannot block finite spectral/operator algebra profiles.                                                                                                                                    |
| Mathlib mitigation/refactor layer      | Use separate path modules;<br>do not import modular APIs into finite physical consumers for convenience.                                                                                                                                                      |
| Bridge gap status                      | Open bridge objects remain late and cannot force early path sequentialization.                                                                                                                                                                                |
| Natural backjump/refactor layer        | If a consumer needs a source from another path, add an explicit bridge dependency rather than moving the whole phase behind that path.                                                                                                                        |
| Implementation prompt contract         | Before implementing any phase, module manifest must state exact source phase IDs and must not inherit unrelated predecessor chains.                                                                                                                           |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                   |
| How implemented                        | Not implemented.                                                                                                                                                                                                                                              |
| Verification / evidence                | Generated-table validation after v37 patch;<br>no Lean build.                                                                                                                                                                                                 |
| Proof strategy                         | Treat phase dependency as provenance obligation;<br>split unrelated consumers rather than sequentializing them through non-required objects.                                                                                                                  |
| Build result                           | No Lean build executed or claimed.                                                                                                                                                                                                                            |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                            |
| Artifact packaging rule                | Return complete zip;<br>Lean build local unless actually executed here.                                                                                                                                                                                       |
| Implementation notes                   | Records dependency and topic-boundary decision before code implementation.                                                                                                                                                                                    |

Phase 8.1 – Eisenstein series profile

**Table legend.**   = green/closed and derived-only;   = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   = orange/implementable after stated predecessor closure;   = yellow/active and implementable now;   = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Eisenstein series profile                                                                                                                                                                                                                                                                                                                                 |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | EXEC-2 likely relevant: algebraic irrational geometry/spectral/modular values are mirror-only unless a rational/integer invariant is separately proved for operational return.                                                                                                                                                                            |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                                                                                                      |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |

|                                   |                                                                                                                                                                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mathlib mitigation/refactor layer | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                 | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract    | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance          | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                   | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence           | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check    | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule           | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes              | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                  | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 8.2 – Weierstrass invariants g2/g3

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                                                                    |

| Phase documentation tier              | F2                                                                                                                                                                                                                                                                                                                                                        |
| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                                                                                                                                                             |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                                                                                                                        |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                                                                                                       |
| Implementation status                 | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                         | Weierstrass invariants g2/g3                                                                                                                                                                                                                                                                                                                              |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy           | QxQ rational floor; exact quadratic coordinates require O09 plus O10/BR14 proof-carrying D-source; no free sqrt(D).                                                                                                                                                                                                                                       |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                           |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet. Exact quadratic use must avoid analytic sqrt/Complex and cite D-source ledger.                                                                                                                           |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 8.3 – Modular discriminant Delta\_mod

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                    |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #f4cccc; border: 1px solid black; padding: 0 2px;">R</span>                                                                                                |
| Context class                         | LeanDerivationPhase                                                                                                                                                                       |
| Phase documentation tier              | F2                                                                                                                                                                                        |
| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.             |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                        |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                       |
| Implementation status                 | planned-not-active                                                                                                                                                                        |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                              |
| Phase type                            | derivation                                                                                                                                                                                |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational. |

|                                        |                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title / state                          | Modular discriminant Delta_mod                                                                                                                                                                                                                                                                                                                            |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | EXEC-2 likely relevant: algebraic irrational geometry/spectral/modular values are mirror-only unless a rational/integer invariant is separately proved for operational return.                                                                                                                                                                            |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |

| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                     |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                               |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                                                                                                         |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                                                                                                       |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                                                                                                        |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.                                                                                         |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                                                                                                            |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited;<br/>additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                                                                                                             |

### Phase 8.4 – j-invariant profile and special-value comparison targets

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | j-invariant profile and special-value comparison targets                                                                                                                                                                                                                                                                                                  |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | EXEC-2 likely relevant: algebraic irrational geometry/spectral/modular values are mirror-only unless a rational/integer invariant is separately proved for operational return.                                                                                                                                                                            |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                     |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                               |

|                                |                                                                                                                                                                                                                                                                |
|--------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| How implemented                | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                              |
| Verification / evidence        | Not applicable yet.                                                                                                                                                                                                                                            |
| Post-implementation plan check | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                             |
| Artifact packaging rule        | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required. |
| Implementation notes           | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                 |
| No-go guardrails               | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                      |

### Phase 8.5 – Eisenstein/Gauss sentinel rows inside the general lattice/computation test matrix: static branching and L\_max sweep

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                  | not-started                                                                                                                                                                                                                                                                                                                                               |
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | documentation/closeout: audit that tests are consumer-only and update proof dossiers.                                                                                                                                                                                                                                                                     |
| Title / state                          | Heuristic lattice test-matrix closeout and public-boundary audit                                                                                                                                                                                                                                                                                          |
| Preparation workflow                   | Prepare when predecessor objects are closed.                                                                                                                                                                                                                                                                                                              |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Already split from the decision lock to keep implementation after source objects exist.                                                                                                                                                                                                                                                                   |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Implement finite rows and witnesses first, then compare against Eisenstein/Gauss targets. Obstructions only after concrete row construction fails.                                              |
| Refactor regression protocol           | No refactor performed in this phase; future code tests must keep the full local build green after each wrapper/test addition.                                                                                                                                                                                                                             |
| Refactor migration metrics             | Not applicable until implementation.                                                                                                                                                                                                                                                                                                                      |
| Lean/mathlib version policy            | Lean/mathlib baseline remains 4.28.0 unless an explicit upgrade gate is opened.                                                                                                                                                                                                                                                                           |
| ExecComplex boundary policy            | Only rational/integer invariants operational; tau/j analytic values are mirror/comparison.                                                                                                                                                                                                                                                                |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | This gate prevents a likely false implementation path: injecting angle heuristics into the generator rather than testing them as comparison targets.                                                                                                                                                                                                      |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending until predecessor objects are available.                                                                                                                                                               |
| Expected tactics                       | Structural constructors/projections, explicit finite-index calculations, and finite relation witnesses; no fragile rewrite chain.                                                                                                                                                                                                                         |
| Expected mathlib imports               | Use existing project imports first; future CM/j mirror tests may require mathlib modular/complex APIs only in non-operational layers after import existence is checked.                                                                                                                                                                                   |
| ExecComplex/computable plan            | Operational path may record only rational/integer outputs: branching code value, finite addresses, collision relations, cos(theta), integer/rational Gram invariants, D target. Complex coordinates, tau, sqrt(D), and analytic j evaluation remain mirror/comparison.                                                                                    |
| Concrete computable instance traversal | Required at preparation: include b=2 static, L_max values spanning 1-4, closure rows for 120/90 degree profiles, and at least one legal dynamic-branching case for 8.6.                                                                                                                                                                                   |
| Computable path non-skeleton status    | Future test implementation must actually traverse finite addresses and compute expected finite invariants, not merely instantiate empty profile records.                                                                                                                                                                                                  |
| Expected executable witness            | Finite test-matrix output rows, not just theorem stubs.                                                                                                                                                                                                                                                                                                   |

|                                      |                                                                                                                                                                                                               |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mathlib complication log             | Record any noncomputable/j/tau/mathlib obstacle and isolate it outside operational path.                                                                                                                      |
| Noncomputable boundary audit         | Mandatory before implementation closes.                                                                                                                                                                       |
| Mathlib mitigation/refactor layer    | Use rational/integer surrogates in operational layer;<br>isolate analytic or algebraic-irrational material in mirror/profile modules.                                                                         |
| Bridge gap status                    | Open: source objects not yet closed.                                                                                                                                                                          |
| Natural backjump/refactor layer      | If tests require new generator semantics, backjump to the canonical generator layer;<br>do not patch the test module.                                                                                         |
| Implementation prompt contract       | Before code: provide module manifest, reuse audit, concrete finite instances, and test matrix rows;<br>do not create duplicate generators.                                                                    |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                   |
| How implemented                      | Planning record only. No Lean code has been changed in this phase.                                                                                                                                            |

### Phase 8.8 – q-expansion and Hilbert class polynomial modular far targets

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                        |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #f4cccc;">R</span>                                                                                                                             |
| Context class                         | LeanDerivationPhase                                                                                                                                                           |
| Phase documentation tier              | F2                                                                                                                                                                            |
| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                            |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                           |
| Implementation status                 | not_started                                                                                                                                                                   |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                  |
| Phase type                            | derivation                                                                                                                                                                    |
| Phase-type-specific contract          | comparison contract: dependency and object placement must be explicit and minimal.                                                                                            |
| Title / state                         | q-expansion and Hilbert class polynomial modular far targets                                                                                                                  |
| Preparation workflow                  | phase dependency bifurcation and semantic placement workflow                                                                                                                  |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                              |

|                                        |                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Split because phase 9 mixed modular and physical consumers and phase 10 mixed modular, spectral, transfer, analytic and bridge targets.                                                                                                                                                                                                                   |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Keep parallel paths after Phase 4; close each path on its own proof-carrying prerequisites.                                                                                                     |
| Module implementation manifest         | No Lean implementation manifest was required when this already-closed/planned infrastructure row was created; under closed LEG10, any future code change touching this phase must fill exact added/modified modules before edits.                                                                                                                         |
| Semantic placement decision            | Existing placement remains historical/planning-only. Future module placement must be revalidated by LEG10 before code changes.                                                                                                                                                                                                                            |
| Reuse and duplication audit            | Not a generator implementation. If later code resembles an existing generator/API, consume LEG11 before edits.                                                                                                                                                                                                                                            |
| Canonical generator policy             | No generator-like code in this record. Future generator-like extensions must route through LEG11.                                                                                                                                                                                                                                                         |
| Module compactness rule                | No one-phase-one-file inference; future modules require semantic/API/import-boundary justification.                                                                                                                                                                                                                                                       |
| Refactor regression protocol           | incremental wrapper mode; full local build green after each migration step                                                                                                                                                                                                                                                                                |
| Refactor migration metrics             | track object reassignments, phase dependency changes, and consumer-path imports                                                                                                                                                                                                                                                                           |
| Lean/mathlib version policy            | 4.28.0 baseline unless version gate explicitly opens upgrade                                                                                                                                                                                                                                                                                              |
| ExecComplex boundary policy            | Phase 4.1 finite matrix is enough for spectral/physical finite consumers; modular/CM analytics remain separate.                                                                                                                                                                                                                                           |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Review after first Phase 10 finite consumer whether the bifurcation prevented a false wait on Phase 8/9.                                                                                                                                                                                                                                                  |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. For each object, list minimal existing sources and reject any extra phase dependency not used by the proof target.                                                                                             |
| Expected tactics                       | planning/generator validation now; later Lean proofs use constructor/projection lemmas over source objects only.                                                                                                                                                                                                                                          |
| Expected mathlib imports               | none for planning lock                                                                                                                                                                                                                                                                                                                                    |
| ExecComplex/computable plan            | Spectral/physical finite profiles consume Phase 4.1 ExecBoundaryMatrix; modular forms/CM consume lattice/number-theory path separately.                                                                                                                                                                                                                   |
| Concrete computable instance traversal | Future finite test rows must run separately for arithmetic/modular and spectral/physical consumers.                                                                                                                                                                                                                                                       |
| Computable path non-skeleton status    | Must be demonstrated by finite rows over Phase 4.1 matrix for spectral/physical path and by D/CM rows for modular path.                                                                                                                                                                                                                                   |
| Expected executable witness            | At least one finite ExecBoundaryMatrix spectral profile row and at least one D-to-modular comparison row when those phases activate.                                                                                                                                                                                                                      |
| Mathlib complication log               | Record if modular-form/mathlib APIs are attempted in spectral/physical path; that is a placement smell unless explicitly justified.                                                                                                                                                                                                                       |
| Noncomputable boundary audit           | Analytic modular/j/L-function objects remain mirror/comparison and cannot block finite spectral/operator algebra profiles.                                                                                                                                                                                                                                |
| Mathlib mitigation/refactor layer      | Use separate path modules; do not import modular APIs into finite physical consumers for convenience.                                                                                                                                                                                                                                                     |
| Bridge gap status                      | Open bridge objects remain late and cannot force early path sequentialization.                                                                                                                                                                                                                                                                            |
| Natural backjump/refactor layer        | If a consumer needs a source from another path, add an explicit bridge dependency rather than moving the whole phase behind that path.                                                                                                                                                                                                                    |
| Implementation prompt contract         | Before implementing any phase, module manifest must state exact source phase IDs and must not inherit unrelated predecessor chains.                                                                                                                                                                                                                       |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                  |
| How implemented                        | Not implemented.                                                                                                                                                                                                                                                                                                                                          |
| Verification / evidence                | Generated-table validation after v37 patch; no Lean build.                                                                                                                                                                                                                                                                                                |
| Proof strategy                         | Treat phase dependency as provenance obligation; split unrelated consumers rather than sequentializing them through non-required objects.                                                                                                                                                                                                                 |
| Build result                           | No Lean build executed or claimed.                                                                                                                                                                                                                                                                                                                        |

|                                      |                                                                                                                                                                                                               |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Post-implementation plan check       | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                            |
| Artifact packaging rule              | Return complete zip;<br>Lean build local unless actually executed here.                                                                                                                                       |
| Implementation notes                 | Records dependency and topic-boundary decision before code implementation.                                                                                                                                    |

| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Spectral, finite physical, transfermatrix, and Schur-bridge consumers after operational boundary matrices                                                                                                                                                                                                                                                 |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                  |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                                                                                                      |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |

|                                   |                                                                                                                                                                                                                                                                       |
|-----------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mathlib complication log          | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit      | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                 | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract    | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance          | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                   | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence           | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check    | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule           | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes              | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                  | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 10.1 – Finite spectral profile from ExecBoundaryMatrix

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                                                                    |

| Implementation status                 | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                         | Finite spectral profile from ExecBoundaryMatrix                                                                                                                                                                                                                                                                                                           |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                 |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 10.2 – Finite operator algebra, star, state, dynamics, unitarity and open-channel profiles

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #f4cccc;">R</span>                                                                                                                                              |
| Context class                         | LeanDerivationPhase                                                                                                                                                                            |
| Phase documentation tier              | F1                                                                                                                                                                                             |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                             |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                            |
| Implementation status                 | planned-not-active                                                                                                                                                                             |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                   |
| Phase type                            | derivation                                                                                                                                                                                     |

|                                        |                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Finite operator algebra, star, state, dynamics, unitarity and open-channel profiles                                                                                                                                                                                                                                                                       |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                     |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |

| Phase documentation tier               | F2                                                                                                                                                                                                                                                                                                                                                        |
| Phase documentation depth requirement  | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                                                                                                                                                             |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                                                                                                                                                        |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                                                                                                       |
| Implementation status                  | planned-not-active                                                                                                                                                                                                                                                                                                                                        |
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                              |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                 |
| Title / state                          | Heat kernel and spectral geometry far targets                                                                                                                                                                                                                                                                                                             |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                 | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                             |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                        |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                                                                                                      |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |

|                                |                                                                                                                                                                                                                                                                       |
|--------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Implementation prompt contract | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance       | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence        | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule        | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes           | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |
| No-go guardrails               | <ul style="list-style-type: none"><li>Global no-go inherited;<br/>additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li></ul>                                                           |

Phase 10.4 – Transfermatrix formalization from Schur recurrence

**Table legend.**   G = green/closed and derived-only;   W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   O = orange/implementable after stated predecessor closure;   Y = yellow/active and implementable now;   R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                   |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split;<br>phase titles and object groups must match the actual mathematical source dependencies.                                                                                                                                                                                                          |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                            |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                               |
| Consumer-contract direction           | Use minimal source objects: Path B consumes Phase 4.1 directly;<br>Path A consumes D/order/lattice/modular prerequisites;<br>bridges are explicit and late.                                                                                                                                                                                               |
| Governance-overhead review            | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                    |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers. Also prepare downstream export shape for BR08 without consuming BR08.                                                                  |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                             |

### Phase 10.4.1 – Multiscale Schur-duality bridge: horizontal sector elimination versus vertical level recursion

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                          |

| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                                    |
| Phase type                            | derivation                                                                                                                                                                                                                                                                      |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                       |
| Title / state                         | Multiscale Schur-duality bridge: horizontal sector elimination versus vertical level recursion                                                                                                                                                                                  |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                         |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                                               |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Not prepared. Must verify that S05, O05, TM0-TM2, CD7, BR06, BR07, S07, and S08 are closed and documented before activation. |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase split decision                   | Expected to split: (a) common block-index product structure, (b) horizontal elimination theorem, (c) vertical recursion theorem, (d) comparison/commutation theorem, (e) obstruction or weakened naturality statement if strict commutation fails.                                                                                                                                                                                                                                                                                      |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Try the positive construction first on a concrete finite generated tree/cut with both sector and level block indices. Express both elimination orders from the same Dirichlet-Laplacian and attempt an entrywise/factorization proof.                                                                                                                                         |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                                                                                                                                                                                                       |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                                                                                                                                                                                                             |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                                                                                                                                                                                              |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                                                                                                                                                                                                |
| Consumer-contract direction            | Consumes S05/O05/TM0/CD7/BR06/BR07/S07/S08 only. Produces BR08/BR09. Must not be imported by earlier route definitions.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                                                                                                                                                                                                     |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Start from the full derived Dirichlet-Laplacian. Introduce two orthogonal decompositions: sector blocks (bright/interface/dark) and level blocks (thread/recursion depth). Define horizontal Schur elimination and vertical Schur recursion as operations on this same matrix. State exact equality, commutation, or functorial factorization only after the domains/codomain indices match. |
| Expected tactics                       | Structural record construction;<br>explicit block/index equivalences;<br>matrix-entry expansion from constructors;<br>local finite-instance witnesses;<br>avoid fragile rewrite chains and generic Matrix.inv.                                                                                                                                                                                                                                                                                                                          |
| Expected mathlib imports               | Matrix block/index support already used by Schur/DtN modules; verify against Lean 4.28.0 when activated. Any mathlib noncomputable pressure must be logged and isolated.                                                                                                                                                                                                                                                                                                                                                                |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Concrete computable instance traversal | Required when active: name one finite generated b-ary approximant/cut, compute both eliminations through the same matrix, and compare outputs.                                                                                                                                                                                                                                                                                                                                                                                          |
| Computable path non-skeleton status    | must provide concrete finite witness before any operational claim                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Expected executable witness            | A finite generated tree/cut witness for horizontal and vertical Schur elimination comparison.                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                                                                                                                                                                                               |
| Bridge gap status                      | Planned bridge gap. If a needed common block-index structure is missing, backjump to the earliest natural Schur/DtN source phase rather than patching BR08.                                                                                                                                                                                                                                                                                                                                                                             |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                                                                                                                                                                                                   |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                                                                                                                                                                                                                                                                                       |

### Phase 10.4.2 – Arithmetic-CD compatibility as Schur-duality corollary

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked

Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                                                                                                                                                     |

| Implementation status                  | planned-not-active                                                                                                                                                                                                                                                                                                                                         |
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                               |
| Phase type                             | derivation                                                                                                                                                                                                                                                                                                                                                 |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                  |
| Title / state                          | Arithmetic-CD compatibility as Schur-duality corollary                                                                                                                                                                                                                                                                                                     |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                                                                    |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Not prepared. Must wait for BR08 and route-specific norm/discriminant objects.                                                                                                                          |
| Phase split decision                   | Likely split into CD norm-source alignment, arithmetic norm-source alignment, coordinate/entry bridge, and final compatibility theorem.                                                                                                                                                                                                                    |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Derive compatibility as a corollary of BR08. Do not assert it from CD/arithmetic resemblance.                                                                                                    |
| Refactor regression protocol           | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                             |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation.                                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                 |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                         |
| Consumer-contract direction            | Consumes BR08/BR09 and route norm objects; produces CD8 only for downstream unification, not for earlier route construction.                                                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                        |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Use BR08 to identify common Schur source. Then show the CD normSq and arithmetic norm/discriminant profiles are projections/invariants of that source under their respective route maps, with exact hypotheses. |
| Expected tactics                       | Record projections, explicit coordinate maps, theorem fields from BR08, finite witness checks, structural proofs over constructor data.                                                                                                                                                                                                                    |
| Expected mathlib imports               | Depends on actual norm/order formalization chosen in earlier number-theory phases; verify against Lean 4.28.0 at activation.                                                                                                                                                                                                                               |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                          |
| Concrete computable instance traversal | Required when active: at least one finite Schur-derived arithmetic example with matching CD-side norm data.                                                                                                                                                                                                                                                |

### Phase 10.4.3 – Cayley-Dickson scalar-surface noncircularity and possible C-layer bridge

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Title / state                         | Cayley-Dickson scalar-surface noncircularity and possible C-layer bridge                                                                                                                       |
| Preparation workflow                  | computable scalar architecture workflow                                                                                                                                                        |

|                                        |                                                                                                                                                                                                                                                                                         |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source-to-CNNA mapping                 | CD9 records whether CD supplies a genuine scalar layer or only comparison/audit data. Horn/GA profiles are routed through GA0-GA6 comparison objects only, with no generator or handoff rights.                                                                                         |
| Dependency-depth audit                 | Scalar architecture decisions must precede code implementation. Exact quadratic or CD scalar routes may not feed earlier generator definitions.                                                                                                                                         |
| Phase split decision                   | split out because ExecComplex limits affect Phase 1.2, 4, 5, 7, 8 and CD bridges differently.                                                                                                                                                                                           |
| Positive path plan                     | Keep current QxQ path first;<br>add exact quadratic pilot only if needed by finite tests and no duplicate module exists;<br>keep analytic Complex mirror-only.                                                                                                                          |
| Module implementation manifest         | pending Phase 1.1.1.1.1                                                                                                                                                                                                                                                                 |
| Semantic placement decision            | scalar-foundation / bridge governance, not generator semantics                                                                                                                                                                                                                          |
| Reuse and duplication audit            | must check existing ExecComplex, ExecComplexBridge, Schur.CharpolyC, ArithmeticCDBridge, and mathlib QuadraticAlgebra before proposing new module                                                                                                                                       |
| Canonical generator policy             | scalar layer must consume canonical generator outputs only;<br>cannot define generator semantics                                                                                                                                                                                        |
| Module compactness rule                | do not create ExactQuadraticComplex unless existing foundation/bridge modules cannot carry the semantics cleanly                                                                                                                                                                        |
| Refactor regression protocol           | incremental wrapper mode;<br>full local build green after each migration step                                                                                                                                                                                                           |
| Refactor migration metrics             | track declarations migrated, imports changed, executable witnesses added                                                                                                                                                                                                                |
| Lean/mathlib version policy            | 4.28.0 baseline unless version gate explicitly opens upgrade                                                                                                                                                                                                                            |
| ExecComplex boundary policy            | EXEC-3 enforced: QxQ floor, exact quadratic optional, analytic Complex mirror-only                                                                                                                                                                                                      |
| Consumer-contract direction            | scalar layer consumes generator/arithmetic source data;<br>generator definitions do not consume scalar comparison/mirror data                                                                                                                                                           |
| Governance-overhead review             | review after first scalar/module manifest whether this lock forced a concrete decision.                                                                                                                                                                                                 |
| Proof rehearsal before implementation  | Only after Schur-duality/CD compatibility closure, prove CD surface generated independently of ExecComplex and not consuming later arithmetic. V1.25 adds Horn/GA material only as downstream target-gate/scratchpad context;<br>it cannot be used as a source object or release proof. |
| Expected tactics                       | explicit structures, constructor/projection lemmas, ring-normal-form only for coordinate arithmetic, no Matrix.inv and no consumer-side patch.                                                                                                                                          |
| Expected mathlib imports               | Mathlib.Algebra.QuadraticAlgebra only if pilot approved;<br>Mathlib.Data.Complex.Basic remains bridge/mirror-only;<br>NumberField modules require version-policy gate.                                                                                                                  |
| ExecComplex/computable plan            | No operational scalar consumption unless bridge is proved.                                                                                                                                                                                                                              |
| Concrete computable instance traversal | required later: QxQ baseline row, Q(i) row, Q(sqrt(-3)) row, and at least one generic D row if O09 is implemented                                                                                                                                                                       |
| Computable path non-skeleton status    | must be shown by concrete row witnesses                                                                                                                                                                                                                                                 |
| Expected executable witness            | finite row with rational ExecComplex output plus optional exact quadratic coordinate and rational/integer invariant projection                                                                                                                                                          |
| Mathlib complication log               | Record Complex/Real noncomputable boundary, QuadraticAlgebra instance diamond warning, NumberField formal/non-executable dependency, and any required version-gate.                                                                                                                     |
| Noncomputable boundary audit           | General C/R and algebraic closure remain mirror/formal. Exact quadratic candidate must avoid noncomputable definitions on operational path.                                                                                                                                             |
| Mathlib mitigation/refactor layer      | Use project-owned explicit Q-coordinate structure or narrowly wrapped QuadraticAlgebra;<br>isolate formal mathlib NumberField in mirror/proof layer.                                                                                                                                    |
| Bridge gap status                      | Open until late bridge prerequisites close.                                                                                                                                                                                                                                             |
| Natural backjump/refactor layer        | If exact quadratic data are needed, backjump to scalar-foundation layer rather than patching arithmetic/lattice consumers.                                                                                                                                                              |
| Implementation prompt contract         | Before Lean code, module manifest must state exact module placement, imported mathlib modules, and why no existing module owns the semantics.                                                                                                                                           |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                             |
| How implemented                        | Not implemented.                                                                                                                                                                                                                                                                        |
| Verification / evidence                | Generated-table validation pending/run after patch;<br>no Lean build.                                                                                                                                                                                                                   |
| Proof strategy                         | Only after Schur-duality/CD compatibility closure, prove CD surface generated independently of ExecComplex and not consuming later arithmetic.                                                                                                                                          |
| Build result                           | No Lean build executed or claimed.                                                                                                                                                                                                                                                      |
| Post-implementation plan check         | Check whether the scalar architecture lock prevented analytic/noncomputable leakage or duplicate scalar implementation.                                                                                                                                                                 |
| Artifact packaging rule                | Return complete zip;<br>Lean build local unless actually executed here.                                                                                                                                                                                                                 |

### Phase 10.5 – Spectral/physical and transfer path closeout before late bridges and Pillar-B export

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                            |
| Phase type                            | derivation                                                                                                                                                                                                              |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                               |
| Title / state                         | Spectral/physical and transfer path closeout before late bridges and Pillar-B export                                                                                                                                    |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Source-to-CNNA mapping                | Object placement follows the corrected v37 path split; phase titles and object groups must match the actual mathematical source dependencies.                                                                           |

|                                        |                                                                                                                                                                                                                                                                                                                                                           |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise. |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                                                                                                               |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                         |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                               |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                  |
| Consumer-contract direction            | Use minimal source objects: Path B consumes Phase 4.1 directly; Path A consumes D/order/lattice/modular prerequisites; bridges are explicit and late.                                                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                       |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                         |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                       |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                   |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                 |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                         |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                     |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                               |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                                                                                                         |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                                                                                                       |
| Post-implementation plan check         | After implementation, verify imports and objects stayed within the v37 path split.                                                                                                                                                                                                                                                                        |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                            |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                                                                                                            |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>Global no-go inherited; additionally no artificial modular-form/j dependency for finite spectral/physical consumers and no phase-title/object mismatch.</li> </ul>                                                                                                                                                 |

### Phase 10.6 – Moved to Phase 13: AQFT KMS/GNS/Tomita-Takesaki consumer targets

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field        | Record |
|--------------|--------|
| Phase status | W      |

|                                       |                                                                                                                                                                                                                         |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Context class                         | DocumentationPhase                                                                                                                                                                                                      |
| Phase documentation tier              | F3                                                                                                                                                                                                                      |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                               |

| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                               |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Dependency-depth audit                | v37 repaired Phase 5-10 dependencies: Path A number-theory/geometric/modular/analytic and Path B spectral/physical/transfer are parallel after Phase 4 unless a specific object bridge says otherwise.                  |
| Proof rehearsal before implementation | Pending. Must be written before implementation starts.                                                                                                                                                                  |
| Bridge gap status                     | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                   |

### Phase 10.7 – Moved to Phase 13: CPT/spin-statistics/Kramers/split/local-net consumer targets

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                        |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                           |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Phase 11.1 – Derive/register object group: A->B bright handoff

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                     |

| Context class                         | LeanDerivationPhase                                                                                                                                                                                                        |
| Phase documentation tier              | F0                                                                                                                                                                                                                         |
| Phase documentation depth requirement | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty.                    |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                         |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                        |
| Implementation status                 | planned-not-active                                                                                                                                                                                                         |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                               |
| Phase type                            | derivation                                                                                                                                                                                                                 |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                  |
| Title / state                         | Derive/register object group: A->B bright handoff                                                                                                                                                                          |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.    |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                          |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.         |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                          |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                          |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                          |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                          |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                          |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>GLOBAL-INHERITED: top-level <code>global_no_go_guardrails</code> apply; this phase list is local addenda only.</li> <li>no <code>@[simp]</code> attributes in the operational path</li> <li>no noncomputable in the operational path</li> <li>no classical helper unless isolated in allowed mirror/non-operational layer</li> <li>no <code>Matrix.inv</code> or external inverse oracle in operational derivations</li> <li>no free formula without proof-carrying entry structure</li> <li>no consumer-side patch when the missing structure belongs earlier</li> <li>no premature obstruction before a serious positive construction attempt</li> <li>no phase-semantic public API names</li> <li>no fragile rewrite chain when a structural constructor/projection proof is available</li> </ul> |

### Phase 11.2 – Derive/register object group: A->B prime/dark future handoff

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                  |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #FFB6C1; border: 1px solid black; padding: 0 2px;">R</span>                                                                                                              |
| Context class                         | LeanDerivationPhase                                                                                                                                                                                     |
| Phase documentation tier              | F0                                                                                                                                                                                                      |
| Phase documentation depth requirement | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                      |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                     |

| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                            |
| Phase type                            | derivation                                                                                                                                                                                              |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.               |
| Title / state                         | Derive/register object group: A->B prime/dark future handoff                                                                                                                                            |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                           |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                              |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 11.3 – Derive/register object group: A->C handoff

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                           |
| Title / state                         | Derive/register object group: A->C handoff                                                                                                                                                                                                          |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                             |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                   |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                  |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                          |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                 |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                   |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                   |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>GLOBAL-INHERITED: top-level <code>global_no_go_guardrails</code> apply; this phase list is local addenda only.</li> <li>no <code>@[simp]</code> attributes in the operational path</li> <li>no noncomputable in the operational path</li> <li>no classical helper unless isolated in allowed mirror/non-operational layer</li> <li>no <code>Matrix.inv</code> or external inverse oracle in operational derivations</li> <li>no free formula without proof-carrying entry structure</li> <li>no consumer-side patch when the missing structure belongs earlier</li> <li>no premature obstruction before a serious positive construction attempt</li> <li>no phase-semantic public API names</li> <li>no fragile rewrite chain when a structural constructor/projection proof is available</li> </ul> |

### Phase 11.4 – Derive/register object group: A->D handoff

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                  |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #FFB6C1; border: 1px solid black; padding: 0 2px;">R</span>                                                                                                              |
| Context class                         | LeanDerivationPhase                                                                                                                                                                                     |
| Phase documentation tier              | F0                                                                                                                                                                                                      |
| Phase documentation depth requirement | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                      |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                     |
| Implementation status                 | planned-not-active                                                                                                                                                                                      |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                            |
| Phase type                            | derivation                                                                                                                                                                                              |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.               |
| Title / state                         | Derive/register object group: A->D handoff                                                                                                                                                              |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                           |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                              |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 11.5 – Derive/register object group: A->E handoff

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |

| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                           |
| Title / state                         | Derive/register object group: A->E handoff                                                                                                                                                                                                          |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                             |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                   |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                  |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                          |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                 |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                   |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                   |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>GLOBAL-INHERITED: top-level <code>global_no_go_guardrails</code> apply; this phase list is local addenda only.</li> <li>no <code>@[simp]</code> attributes in the operational path</li> <li>no noncomputable in the operational path</li> <li>no classical helper unless isolated in allowed mirror/non-operational layer</li> <li>no <code>Matrix.inv</code> or external inverse oracle in operational derivations</li> <li>no free formula without proof-carrying entry structure</li> <li>no consumer-side patch when the missing structure belongs earlier</li> <li>no premature obstruction before a serious positive construction attempt</li> <li>no phase-semantic public API names</li> <li>no fragile rewrite chain when a structural constructor/projection proof is available</li> </ul> |

## Phase 12 – Established mathematics beyond j: finite simple groups, Leech/VOA, Monster/Moonshine and post-j arithmetic register

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                            |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                           |
| Implementation status                 | planned-not-active                                                                                                                                                            |
| Preparation status                    | source-audited-not-active                                                                                                                                                     |
| Phase type                            | comparison                                                                                                                                                                    |
| Phase-type-specific contract          | Comparison/secondary phase: record derived-only boundary and prevent comparison targets from becoming CNNA-generative inputs.                                                 |
| Title / state                         | Established mathematics beyond j: finite simple groups, Leech/VOA, Monster/Moonshine and post-j arithmetic register                                                           |

|                                        |                                                                                                                                                                                                                                                                                                                     |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                                                                             |
| Source-to-CNNA mapping                 | Thread data are roadmap/reference material only. CNNA must first derive j/q-expansion or a graded/lattice/algebraic stream from Pillar-A provenance; only then may finite simple groups, Leech, VOA, Monster, Hauptmoduln or McKay-Thompson series be used as comparison targets.                                   |
| Dependency-depth audit                 | Deep and intentionally late. Current plan already has j/Moonshine placeholders, but TomS thread requires finer comparison-only subphases for finite simple groups, Leech/theta, VOA/moonshine module, and common-indicator/Hauptmodul tests.                                                                        |
| Phase split decision                   | Split phase 12 into 12.1-12.8: keep 12.1-12.3 for j/Moonshine/McKay-Thompson; add 12.4-12.8 for finite-simple-group context, Leech lattice, Leech theta, VOA/moonshine module, and common-indicator bridge tests.                                                                                                   |
| Positive path plan                     | Maintain the positive derived-only path: build A-derived j/q data first; compare to external Moonshine structures later; do not use thread claims, Monster data, Leech coefficients, L-functions, or string-theory/VOA facts as upstream axioms.                                                                    |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                   |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                         |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                          |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                                                       |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                 |
| Proof rehearsal before implementation  | No Lean implementation yet. Formalization would start with small comparison records and computable coefficient prefixes; analytic/classification/VOA content remains behind explicit mirror/comparison boundaries.                                                                                                  |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                   |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                   |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                   |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                 |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                             |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                   |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                        |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                           |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                               |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                               |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                         |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                                                                   |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                                                                 |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                                                                  |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                      |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                                                                      |

### Phase 12.1 – q-expansion coefficient stream for j as established arithmetic output

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                               |
| Phase type                            | derivation                                                                                                                                                                                                                 |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                  |
| Title / state                         | q-expansion coefficient stream for j as established arithmetic output                                                                                                                                                      |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.    |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                          |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.         |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                          |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

### Phase 12.2 – Moonshine comparison profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                    | not-prepared                                                                                                                                                                                                            |
| Phase type                            | comparison                                                                                                                                                                                                              |
| Phase-type-specific contract          | Comparison/secondary phase: record derived-only boundary and prevent comparison targets from becoming CNNA-generative inputs.                                                                                           |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Dependency-depth audit                | Pending. Must be completed before this phase may become active.                                                                                                                                                         |
| Proof rehearsal before implementation | Pending. Must be written before implementation starts.                                                                                                                                                                  |
| Bridge gap status                     | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                   |

### Phase 12.3 – McKay-Thompson side profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                     |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #f4cccc;">R</span>                                                                                                                                                                          |
| Context class                         | LeanDerivationPhase                                                                                                                                                                                                        |
| Phase documentation tier              | F2                                                                                                                                                                                                                         |
| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                              |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                         |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                        |
| Implementation status                 | planned                                                                                                                                                                                                                    |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                               |
| Phase type                            | derivation                                                                                                                                                                                                                 |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                  |
| Title / state                         | McKay-Thompson side profile                                                                                                                                                                                                |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.    |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                          |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.         |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                          |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>GLOBAL-INHERITED: top-level global_no_go_guardrails apply; this phase list is local addenda only.</li> <li>no @[simp] attributes in the operational path</li> <li>no noncomputable in the operational path</li> <li>no classical helper unless isolated in allowed mirror/non-operational layer</li> <li>no Matrix.inv or external inverse oracle in operational derivations</li> <li>no free formula without proof-carrying entry structure</li> <li>no consumer-side patch when the missing structure belongs earlier</li> <li>no premature obstruction before a serious positive construction attempt</li> <li>no phase-semantic public API names</li> <li>no fragile rewrite chain when a structural constructor/projection proof is available</li> </ul> |

### Phase 12.4 – Finite simple group comparison context after modular/j layer

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field        | Record |
|--------------|--------|
| Phase status | W      |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Context class                          | ReferenceGatePhase                                                                                                                                                                                                                                                    |
| Phase documentation tier               | F2                                                                                                                                                                                                                                                                    |
| Phase documentation depth requirement  | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                                                                         |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                                                                    |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                   |
| Implementation status                  | planned                                                                                                                                                                                                                                                               |
| Preparation status                     | source-audited-not-active                                                                                                                                                                                                                                             |
| Phase type                             | comparison                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Comparison/secondary phase: record derived-only boundary and prevent comparison targets from becoming CNNA-generative inputs.                                                                                                                                         |
| Title / state                          | Finite simple group comparison context after modular/j layer                                                                                                                                                                                                          |
| Preparation workflow                   | Source-preparation workflow completed at roadmap level only: extract thread objects, classify as derived target vs comparison-only, map to phase/object IDs, and keep formal proof rehearsal for activation time.                                                     |
| Source-to-CNNA mapping                 | CFSG is a comparison taxonomy for possible CNNA-derived symmetry/graded objects;<br>it is not an A-source theorem.                                                                                                                                                    |
| Dependency-depth audit                 | Very deep. Requires completed A-derived j/q-expansion or later graded/lattice/algebra output before any comparison is meaningful. Therefore it remains black/white horizon material, not an active proof target.                                                      |
| Phase split decision                   | Keep as a planned comparison-only subphase;<br>split further when activated if formal objects require deep algebraic prerequisites.                                                                                                                                   |
| Positive path plan                     | Do not start by falsifying or importing an established target. First derive CNNA data from A provenance;<br>then perform finite-prefix or theorem-level comparison against the registered external target.                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                 |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | Pending until all predecessor CNNA objects are available. Expected shape: define comparison records, prove coefficient/table equality for finite prefixes if computable, and isolate analytic/global equality as mirror theorem if needed.                            |
| Expected tactics                       | Use explicit records, finite list/vector comparisons, Nat/Int arithmetic certificates, and theorem forwarding. Avoid broad simplification or opaque imported classification assumptions.                                                                              |
| Expected mathlib imports               | To be verified against mathlib 4.28.0 at activation time. Likely areas: algebra/group/basic finite groups for comparison tags, polynomials/series for q-prefixes, no large external theorem import in operational path.                                               |
| ExecComplex/computable plan            | Any comparison prefix must be computable data. Infinite series, analytic equality, VOA structures, and classification theorems remain mirror/comparison layers unless separately derived.                                                                             |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No immediate Lean bridge required. Missing structures belong earlier: j/q-expansion, graded q-character, lattice/theta candidate, or B-derived algebraic consumer, depending on the subphase.                                                                         |
| Natural backjump/refactor layer        | If activation reveals missing data, backjump to the earliest natural generator: modular q-expansion for MOON0, graded-character source before MOON8, lattice/theta source before MOON5-6, or B algebra before MOON7.                                                  |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master after TomS thread cross-check.                                                                                                                                             |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Phase 12.5 – Leech lattice comparison profile

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                        |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                             |
| Context class                         | ReferenceGatePhase                                                                                                                                                            |
| Phase documentation tier              | F2                                                                                                                                                                            |
| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                            |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                           |
| Implementation status                 | planned                                                                                                                                                                       |
| Preparation status                    | source-audited-not-active                                                                                                                                                     |
| Phase type                            | comparison                                                                                                                                                                    |
| Phase-type-specific contract          | Comparison/secondary phase: record derived-only boundary and prevent comparison targets from becoming CNNA-generative inputs.                                                 |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title / state                          | Leech lattice comparison profile                                                                                                                                                                                                                                      |
| Preparation workflow                   | Source-preparation workflow completed at roadmap level only: extract thread objects, classify as derived target vs comparison-only, map to phase/object IDs, and keep formal proof rehearsal for activation time.                                                     |
| Source-to-CNNA mapping                 | Leech data are registered only as target fingerprints for later derived lattice/theta-like CNNA outputs.                                                                                                                                                              |
| Dependency-depth audit                 | Very deep. Requires completed A-derived j/q-expansion or later graded/lattice/algebra output before any comparison is meaningful. Therefore it remains black/white horizon material, not an active proof target.                                                      |
| Phase split decision                   | Keep as a planned comparison-only subphase;<br>split further when activated if formal objects require deep algebraic prerequisites.                                                                                                                                   |
| Positive path plan                     | Do not start by falsifying or importing an established target. First derive CNNA data from A provenance;<br>then perform finite-prefix or theorem-level comparison against the registered external target.                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                           |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | Pending until all predecessor CNNA objects are available. Expected shape: define comparison records, prove coefficient/table equality for finite prefixes if computable, and isolate analytic/global equality as mirror theorem if needed.                            |
| Expected tactics                       | Use explicit records, finite list/vector comparisons, Nat/Int arithmetic certificates, and theorem forwarding. Avoid broad simplification or opaque imported classification assumptions.                                                                              |
| Expected mathlib imports               | To be verified against mathlib 4.28.0 at activation time. Likely areas: algebra/group/basic finite groups for comparison tags, polynomials/series for q-prefixes, no large external theorem import in operational path.                                               |
| ExecComplex/computable plan            | Any comparison prefix must be computable data. Infinite series, analytic equality, VOA structures, and classification theorems remain mirror/comparison layers unless separately derived.                                                                             |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No immediate Lean bridge required. Missing structures belong earlier: j/q-expansion, graded q-character, lattice/theta candidate, or B-derived algebraic consumer, depending on the subphase.                                                                         |
| Natural backjump/refactor layer        | If activation reveals missing data, backjump to the earliest natural generator: modular q-expansion for MOON0, graded-character source before MOON8, lattice/theta source before MOON5-6, or B algebra before MOON7.                                                  |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master after TomS thread cross-check.                                                                                                                                             |
| Verification / evidence                | Pending;<br>phase is not active. Source material was classified but no Lean proof is claimed.                                                                                                                                                                         |
| Proof strategy                         | To be specified when this phase becomes active. Positive path: derive CNNA-side stream/object first, then compare to external target;<br>never import target data as a generator.                                                                                     |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet. When implemented, mark object status white only if provenance, access rights, and comparison/derivation boundary are explicit.                                                                                                                     |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven or derivable yet.                                                                                                                                                                                        |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Phase 12.6 – Leech theta/shell and kissing-number comparison stream

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                               |
| Implementation status                 | planned                                                                                                                                                                                                           |
| Preparation status                    | source-audited-not-active                                                                                                                                                                                         |
| Phase type                            | comparison                                                                                                                                                                                                        |
| Phase-type-specific contract          | Comparison/secondary phase: record derived-only boundary and prevent comparison targets from becoming CNNA-generative inputs.                                                                                     |
| Title / state                         | Leech theta/shell and kissing-number comparison stream                                                                                                                                                            |
| Preparation workflow                  | Source-preparation workflow completed at roadmap level only: extract thread objects, classify as derived target vs comparison-only, map to phase/object IDs, and keep formal proof rehearsal for activation time. |
| Source-to-CNNA mapping                | The theta/shell numbers may be finite comparison targets only after CNNA produces its own coefficient stream.                                                                                                     |
| Dependency-depth audit                | Very deep. Requires completed A-derived j/q-expansion or later graded/lattice/algebra output before any comparison is meaningful. Therefore it remains black/white horizon material, not an active proof target.  |
| Phase split decision                  | Keep as a planned comparison-only subphase; split further when activated if formal objects require deep algebraic prerequisites.                                                                                  |
| Positive path plan                    | Do not start by falsifying or importing an established target. First derive CNNA data from A provenance; then perform finite-prefix or theorem-level comparison against the registered external target.           |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                 |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                       |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | Pending until all predecessor CNNA objects are available. Expected shape: define comparison records, prove coefficient/table equality for finite prefixes if computable, and isolate analytic/global equality as mirror theorem if needed.                            |
| Expected tactics                       | Use explicit records, finite list/vector comparisons, $\mathbb{N}$ / $\mathbb{Z}$ arithmetic certificates, and theorem forwarding. Avoid broad simplification or opaque imported classification assumptions.                                                          |
| Expected mathlib imports               | To be verified against mathlib 4.28.0 at activation time. Likely areas: algebra/group/basic finite groups for comparison tags, polynomials/series for q-prefixes, no large external theorem import in operational path.                                               |
| ExecComplex/computable plan            | Any comparison prefix must be computable data. Infinite series, analytic equality, VOA structures, and classification theorems remain mirror/comparison layers unless separately derived.                                                                             |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No immediate Lean bridge required. Missing structures belong earlier: j/q-expansion, graded q-character, lattice/theta candidate, or B-derived algebraic consumer, depending on the subphase.                                                                         |
| Natural backjump/refactor layer        | If activation reveals missing data, backjump to the earliest natural generator: modular q-expansion for MOON0, graded-character source before MOON8, lattice/theta source before MOON5-6, or B algebra before MOON7.                                                  |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all <code>global_no_go_guardrails</code> inherited (GNG01-GNG24)                                                                                                                                                                                              |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master after TomS thread cross-check.                                                                                                                                             |
| Verification / evidence                | Pending;<br>phase is not active. Source material was classified but no Lean proof is claimed.                                                                                                                                                                         |
| Proof strategy                         | To be specified when this phase becomes active. Positive path: derive CNNA-side stream/object first, then compare to external target; never import target data as a generator.                                                                                        |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet. When implemented, mark object status white only if provenance, access rights, and comparison/derivation boundary are explicit.                                                                                                                     |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven or derivable yet.                                                                                                                                                                                        |

### Phase 12.7 – Vertex-operator-algebra / moonshine-module comparison boundary

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                     |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                                                          |
| Context class                         | ReferenceGatePhase                                                                                                                                                                                                         |
| Phase documentation tier              | F2                                                                                                                                                                                                                         |
| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                              |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                         |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                        |
| Implementation status                 | planned                                                                                                                                                                                                                    |
| Preparation status                    | source-audited-not-active                                                                                                                                                                                                  |
| Phase type                            | comparison                                                                                                                                                                                                                 |
| Phase-type-specific contract          | Comparison/secondary phase: record derived-only boundary and prevent comparison targets from becoming CNNA-generative inputs.                                                                                              |
| Title / state                         | Vertex-operator-algebra / moonshine-module comparison boundary                                                                                                                                                             |
| Preparation workflow                  | Source-preparation workflow completed at roadmap level only: extract thread objects, classify as derived target vs comparison-only, map to phase/object IDs, and keep formal proof rehearsal for activation time.          |
| Source-to-CNNA mapping                | VOA and string-theory context are late comparison/consumer targets, not generative inputs.                                                                                                                                 |
| Dependency-depth audit                | Very deep. Requires completed A-derived j/q-expansion or later graded/lattice/algebra output before any comparison is meaningful. Therefore it remains black/white horizon material, not an active proof target.           |
| Phase split decision                  | Keep as a planned comparison-only subphase; split further when activated if formal objects require deep algebraic prerequisites.                                                                                           |
| Positive path plan                    | Do not start by falsifying or importing an established target. First derive CNNA data from A provenance; then perform finite-prefix or theorem-level comparison against the registered external target.                    |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof rehearsal before implementation  | Pending until all predecessor CNNA objects are available. Expected shape: define comparison records, prove coefficient/table equality for finite prefixes if computable, and isolate analytic/global equality as mirror theorem if needed.                            |
| Expected tactics                       | Use explicit records, finite list/vector comparisons, Nat/Int arithmetic certificates, and theorem forwarding. Avoid broad simplification or opaque imported classification assumptions.                                                                              |
| Expected mathlib imports               | To be verified against mathlib 4.28.0 at activation time. Likely areas: algebra/group/basic finite groups for comparison tags, polynomials/series for q-prefixes, no large external theorem import in operational path.                                               |
| ExecComplex/computable plan            | Any comparison prefix must be computable data. Infinite series, analytic equality, VOA structures, and classification theorems remain mirror/comparison layers unless separately derived.                                                                             |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No immediate Lean bridge required. Missing structures belong earlier: j/q-expansion, graded q-character, lattice/theta candidate, or B-derived algebraic consumer, depending on the subphase.                                                                         |
| Natural backjump/refactor layer        | If activation reveals missing data, backjump to the earliest natural generator: modular q-expansion for MOON0, graded-character source before MOON8, lattice/theta source before MOON5-6, or B algebra before MOON7.                                                  |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master after TomS thread cross-check.                                                                                                                                             |
| Verification / evidence                | Pending;<br>phase is not active. Source material was classified but no Lean proof is claimed.                                                                                                                                                                         |
| Proof strategy                         | To be specified when this phase becomes active. Positive path: derive CNNA-side stream/object first, then compare to external target; never import target data as a generator.                                                                                        |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet. When implemented, mark object status white only if provenance, access rights, and comparison/derivation boundary are explicit.                                                                                                                     |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven or derivable yet.                                                                                                                                                                                        |

### Phase 12.8 – Common-indicator / Hauptmodul bridge-test register

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                                                                              |

| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                                                                                                                           |
| Title / state                         | Common-indicator / Hauptmodul bridge-test register                                                                                                                                                                                                                                                                                                                  |
| Preparation workflow                  | Source-preparation workflow completed at roadmap level only: extract thread objects, classify as derived target vs comparison-only, map to phase/object IDs, and keep formal proof rehearsal for activation time.                                                                                                                                                   |
| Source-to-CNNA mapping                | The common indicator is a post-derived comparison test: derived CNNA q-character first, known Hauptmodul/McKay-Thompson target second.                                                                                                                                                                                                                              |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Very deep. Requires completed A-derived j/q-expansion or later graded/lattice/algebra output before any comparison is meaningful. Therefore it remains black/white horizon material, not an active proof target. |
| Phase split decision                  | Keep as a planned comparison-only subphase; split further when activated if formal objects require deep algebraic prerequisites.                                                                                                                                                                                                                                    |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Do not start by falsifying or importing an established target. First derive CNNA data from A provenance; then perform finite-prefix or theorem-level comparison against the registered external target.   |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation.                                                                                                    |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                          |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                            |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                                                                                                       |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending until all predecessor CNNA objects are available. Expected shape: define comparison records, prove coefficient/table equality for finite prefixes if computable, and isolate analytic/global equality as mirror theorem if needed. |
| Expected tactics                       | Use explicit records, finite list/vector comparisons, Nat/Int arithmetic certificates, and theorem forwarding. Avoid broad simplification or opaque imported classification assumptions.                                                                                                                                                                                              |
| Expected mathlib imports               | To be verified against mathlib 4.28.0 at activation time. Likely areas: algebra/group/basic finite groups for comparison tags, polynomials/series for q-prefixes, no large external theorem import in operational path.                                                                                                                                                               |
| ExecComplex/computable plan            | Any comparison prefix must be computable data. Infinite series, analytic equality, VOA structures, and classification theorems remain mirror/comparison layers unless separately derived.                                                                                                                                                                                             |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                                             |
| Bridge gap status                      | No immediate Lean bridge required. Missing structures belong earlier: j/q-expansion, graded q-character, lattice/theta candidate, or B-derived algebraic consumer, depending on the subphase.                                                                                                                                                                                         |
| Natural backjump/refactor layer        | If activation reveals missing data, backjump to the earliest natural generator: modular q-expansion for MOON0, graded-character source before MOON8, lattice/theta source before MOON5-6, or B algebra before MOON7.                                                                                                                                                                  |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                                                 |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master after TomS thread cross-check.                                                                                                                                                                                                                                                             |
| Verification / evidence                | Pending;<br>phase is not active. Source material was classified but no Lean proof is claimed.                                                                                                                                                                                                                                                                                         |
| Proof strategy                         | To be specified when this phase becomes active. Positive path: derive CNNA-side stream/object first, then compare to external target;<br>never import target data as a generator.                                                                                                                                                                                                     |
| Build result                           | not run                                                                                                                                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet. When implemented, mark object status white only if provenance, access rights, and comparison/derivation boundary are explicit.                                                                                                                                                                                                                                     |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.                                                                                                                     |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven or derivable yet.                                                                                                                                                                                                                                                                                                        |

Phase 13 – Pillar B QFT/AQFT consumer roadmap from A outputs

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                     |

| Context class                         | LeanDerivationPhase                                                                                                                                                                                                        |
| Phase documentation tier              | F0                                                                                                                                                                                                                         |
| Phase documentation depth requirement | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty.                    |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                         |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                        |
| Implementation status                 | planned                                                                                                                                                                                                                    |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                               |
| Phase type                            | derivation                                                                                                                                                                                                                 |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                  |
| Title / state                         | Pillar B QFT/AQFT consumer roadmap from A outputs                                                                                                                                                                          |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.    |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                          |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.         |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                          |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                          |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Phase 13.1 – B input contract from A bright boundary handoff

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                  |

| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                          |
| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | B input contract from A bright boundary handoff                                                                                                                                                                                                                       |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                        |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                 |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |

### Phase 13.2 – Boundary star-algebra / observable algebra

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                 | planned                                                                                                                                                                                                                                                          |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                                     |
| Phase type                            | derivation                                                                                                                                                                                                                                                       |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                        |
| Title / state                         | Boundary star-algebra / observable algebra                                                                                                                                                                                                                       |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                          |
| Source-to-CNNA mapping                | Not prepared yet. Horn/GA profiles are routed through GA0-GA6 comparison objects only, with no generator or handoff rights.                                                                                                                                      |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                               |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                                |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                      |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                   |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                       |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                               |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                    |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                              |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Phase 13.2.1 – Pauli/Clifford boundary-star-algebra comparison gate

**Table legend.**   = green/closed and derived-only;   = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   = orange/implementable after stated predecessor closure;   = yellow/active and implementable now;   = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                  | planned-not-active                                                                                                                                                                                                        |
| Preparation status                     | planned-prepared                                                                                                                                                                                                          |
| Phase type                             | comparison                                                                                                                                                                                                                |
| Phase-type-specific contract           | Comparison/reference phase: records external target criteria and scratchpad information; it cannot supply CNNA premises or release mathematical phases.                                                                   |
| Title / state                          | Pauli/Clifford boundary-star-algebra comparison gate                                                                                                                                                                      |
| Preparation workflow                   | External-source intake as comparison/reference gate with derived-only boundary.                                                                                                                                           |
| Source-to-CNNA mapping                 | Maps external Pauli/Clifford patterns to a later B-consumer check after boundary *-algebra is derived from A->B handoff.                                                                                                  |
| Dependency-depth audit                 | Locked behind 13.2 and A->B handoff data. It cannot inspect A internals or supply B generators.                                                                                                                           |
| Phase split decision                   | Split into narrow comparison gates so CD, Pillar-B boundary algebra, Dirac/STA and side-comparison targets do not collapse into one ambiguous external-theory phase.                                                      |
| Positive path plan                     | Do not implement proof code yet. Keep target invariants in scratchpad; when predecessor data is closed, add a small neutral comparison API and prove/falsify explicitly.                                                  |
| Module implementation manifest         | No Lean modules in V1.25. Future optional modules must be neutral ReferenceGates/ComparisonGate modules, not phase-named public APIs.                                                                                     |
| Semantic placement decision            | Natural placement is comparison/reference-gate layer, not a foundational CNNA derivation layer.                                                                                                                           |
| Reuse and duplication audit            | Reuses existing CD, Pillar-B and side-comparison umbrella phases; new rows are target-gate refinements, not duplicate derivation phases.                                                                                  |
| Canonical generator policy             | The only generator remains the CNNA Lean/provenance chain. External theory may only define target profiles for later comparison.                                                                                          |
| Module compactness rule                | Keep future comparison APIs small and isolated; no broad GA framework should be introduced before a concrete CNNA-derived comparison need exists.                                                                         |
| Refactor regression protocol           | No Lean refactor in V1.25. Future module changes require import graph check, consumer discipline audit and full local Lean build evidence.                                                                                |
| Refactor migration metrics             | No Lean migration. Future comparison module metrics: declarations added, imports added, consumer count, and target/equality proofs closed.                                                                                |
| Lean/mathlib version policy            | Baseline remains pinned Lean/mathlib snapshot; live documentation is only a source-discovery hint until verified locally against the pin.                                                                                 |
| ExecComplex boundary policy            | Do not replace ExecComplex or CNNA scalar provenance with external complex quaternions or analytic Complex.                                                                                                               |
| Consumer-contract direction            | Comparison consumers may read CNNA-derived outputs; CNNA derivation phases may not consume the comparison profile as a generator.                                                                                         |
| Governance-overhead review             | Added overhead is justified because sign, unit and semantic ambiguities are high-risk; gates are narrow to avoid broad external-theory creep.                                                                             |
| Proof rehearsal before implementation  | Future proof should derive B generators from boundary algebra, then compare against Clifford target relations through a minimal profile or mathlib Clifford lift only if version-pinned and noncircular.                  |
| Expected tactics                       | Future Lean work should use explicit structures, field/projection equalities, constructor-based proofs, local case splits and finite matrix entry proofs; avoid broad simp/simpa collapse and opaque native_decide goals. |
| Expected mathlib imports               | Reference candidates only: Mathlib.Algebra.Quaternion, Mathlib.Analysis.Quaternion, Mathlib.LinearAlgebra.CliffordAlgebra.Basic. Verify against the pinned Lean/mathlib snapshot before any implementation.               |
| ExecComplex/computable plan            | No ExecComplex object introduced. If finite numeric checks are later needed, keep them mirror/diagnostic unless an exact CNNA-derived computable path is proved.                                                          |
| Concrete computable instance traversal | Concrete traversal currently consists of source equation/profile extraction and target-object registration; no CNNA runtime traversal yet.                                                                                |
| Computable path non-skeleton status    | Reference skeleton only. It must not be presented as computable CNNA evidence until future exact instances are constructed.                                                                                               |
| Expected executable witness            | For V1.25: generated TSV/TEX/PDF artifacts. Future Lean witness: explicit comparison structure instantiated from CNNA-derived objects.                                                                                    |
| Mathlib complication log               | Current web docs indicate available Quaternion and CliffordAlgebra APIs, but the project pin is Lean/mathlib 4.28.0; implementation must recheck exact names and theorem availability.                                    |
| Noncomputable boundary audit           | No noncomputable Lean code introduced. Future use of analytic/normed quaternion APIs must be isolated from operational paths unless explicitly allowed.                                                                   |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mathlib mitigation/refactor layer    | If mathlib Clifford/Quaternion APIs pull noncomputable/classical pressure, keep them in mirror/comparison modules or define a minimal finite target profile instead.                                                                                                                                                                                                                                           |
| Bridge gap status                    | Bridge intentionally open. The external reference describes target shapes; CNNA must derive any matching structure internally before comparison.                                                                                                                                                                                                                                                               |
| Natural backjump/refactor layer      | If the comparison needs missing structure, patch only the earliest natural CNNA layer where that structure is generated, not the comparison/consumer phase.                                                                                                                                                                                                                                                    |
| Implementation prompt contract       | Future implementation prompt must state comparison-only status, predecessor objects, no new generator axioms, no external-theory imports unless pinned and isolated, and exact target equalities/failures.                                                                                                                                                                                                     |
| Global no-go inheritance             | All global no-go guardrails apply, especially derived-only, positive-path-first, patch-at-natural-origin and reference-theory-as-target-only rules.                                                                                                                                                                                                                                                            |
| How implemented                      | Planned reference/target-gate integration only. V1.25 records source reading, object links, proof-dossier placeholders and scratchpad material; no Lean code is implemented.                                                                                                                                                                                                                                   |
| Verification / evidence              | YAML generator validation and generated table/PDF outputs after V1.25 update. No Lean build evidence because no Lean source changed.                                                                                                                                                                                                                                                                           |
| Proof strategy                       | Positive path: wait for the natural CNNA predecessor objects, then encode the smallest comparison profile and prove target equality/failure from CNNA data only.                                                                                                                                                                                                                                               |
| Build result                         | No Lean build run; no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                                                                                                                 |
| Post-implementation plan check       | After any future comparison implementation, record whether the target matched, failed, or required a natural-origin backjump; do not smooth failure into a weakened claim.                                                                                                                                                                                                                                     |
| Artifact packaging rule              | Package YAML, generated tables, generated PDF and report. Do not package external PDFs as generated project truth unless they are user-uploaded source material.                                                                                                                                                                                                                                               |
| Implementation notes                 | External theory is recorded only as comparison material. It may suggest target invariants, sign audits and future checks, but cannot release phases or provide CNNA generators.                                                                                                                                                                                                                                |

Phase 13.3 – Local net and Haag-Kastler algebraic profile

**Table legend.**   = green/closed and derived-only;   = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   = orange/implementable after stated predecessor closure;   = yellow/active and implementable now;   = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | Local net and Haag-Kastler algebraic profile                                                                                                                                                                                                                          |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                           |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                              |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                  |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Phase 13.4 – State, GNS, and KMS consumer layer

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                               |
| Title / state                         | State, GNS, and KMS consumer layer                                                                                                                                                                                      |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                       |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.      |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                       |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                             |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

Phase 13.5 – Tomita-Takesaki and modular data

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                  | planned                                                                                                                                                                                                                                                               |
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                          |
| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | Tomita-Takesaki and modular data                                                                                                                                                                                                                                      |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                           |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |

|                                |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

### Phase 13.6 – CPT, spin-statistics, Kramers and split-property gates

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                          |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                      |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                     |
| Implementation status                 | planned                                                                                                                                                                                                                 |
| Preparation status                    | not-prepared                                                                                                                                                                                                            |
| Phase type                            | infrastructure                                                                                                                                                                                                          |
| Phase-type-specific contract          | Infrastructure/planning phase: justify absence of operational witness; close schema/decision prerequisites before code.                                                                                                 |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Dependency-depth audit                | Pending. Must be completed before this phase may become active.                                                                                                                                                         |
| Proof rehearsal before implementation | Pending. Must be written before implementation starts. V1.25 adds Horn/GA material only as downstream target-gate/scratchpad context; it cannot be used as a source object or release proof.                            |
| Bridge gap status                     | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                   |

Phase 13.6.1 – Dirac/spacetime-algebra comparison target behind CPT, spin-statistics and split gates

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                     |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                           | W                                                                                                                                                                                                                          |
| Context class                          | ReferenceGatePhase                                                                                                                                                                                                         |
| Phase documentation tier               | F2                                                                                                                                                                                                                         |
| Phase documentation depth requirement  | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                              |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                         |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                        |
| Implementation status                  | planned-not-active                                                                                                                                                                                                         |
| Preparation status                     | planned-prepared                                                                                                                                                                                                           |
| Phase type                             | comparison                                                                                                                                                                                                                 |
| Phase-type-specific contract           | Comparison/reference phase: records external target criteria and scratchpad information; it cannot supply CNNA premises or release mathematical phases.                                                                    |
| Title / state                          | Dirac/spacetime-algebra comparison target behind CPT, spin-statistics and split gates                                                                                                                                      |
| Preparation workflow                   | External-source intake as comparison/reference gate with derived-only boundary.                                                                                                                                            |
| Source-to-CNNA mapping                 | Maps Dirac/STA material to a late Pillar-B target gate only after local net, modular data and structural theorem hypotheses are CNNA-derived.                                                                              |
| Dependency-depth audit                 | Depends on 13.5/13.6 and GA4; does not unblock any Pillar-B derivation. No Lorentz/Dirac/spacetime structure is imported.                                                                                                  |
| Phase split decision                   | Split into narrow comparison gates so CD, Pillar-B boundary algebra, Dirac/STA and side-comparison targets do not collapse into one ambiguous external-theory phase.                                                       |
| Positive path plan                     | Do not implement proof code yet. Keep target invariants in scratchpad; when predecessor data is closed, add a small neutral comparison API and prove/falsify explicitly.                                                   |
| Module implementation manifest         | No Lean modules in V1.25. Future optional modules must be neutral ReferenceGates/ComparisonGate modules, not phase-named public APIs.                                                                                      |
| Semantic placement decision            | Natural placement is comparison/reference-gate layer, not a foundational CNNA derivation layer.                                                                                                                            |
| Reuse and duplication audit            | Reuses existing CD, Pillar-B and side-comparison umbrella phases; new rows are target-gate refinements, not duplicate derivation phases.                                                                                   |
| Canonical generator policy             | The only generator remains the CNNA Lean/provenance chain. External theory may only define target profiles for later comparison.                                                                                           |
| Module compactness rule                | Keep future comparison APIs small and isolated; no broad GA framework should be introduced before a concrete CNNA-derived comparison need exists.                                                                          |
| Refactor regression protocol           | No Lean refactor in V1.25. Future module changes require import graph check, consumer discipline audit and full local Lean build evidence.                                                                                 |
| Refactor migration metrics             | No Lean migration. Future comparison module metrics: declarations added, imports added, consumer count, and target/equality proofs closed.                                                                                 |
| Lean/mathlib version policy            | Baseline remains pinned Lean/mathlib snapshot; live documentation is only a source-discovery hint until verified locally against the pin.                                                                                  |
| ExecComplex boundary policy            | Do not replace ExecComplex or CNNA scalar provenance with external complex quaternions or analytic Complex.                                                                                                                |
| Consumer-contract direction            | Comparison consumers may read CNNA-derived outputs; CNNA derivation phases may not consume the comparison profile as a generator.                                                                                          |
| Governance-overhead review             | Added overhead is justified because sign, unit and semantic ambiguities are high-risk; gates are narrow to avoid broad external-theory creep.                                                                              |
| Proof rehearsal before implementation  | Future proof compares CNNA-derived B structures with gamma/STA target signatures and structural theorem hypotheses; any mismatch becomes an explicit comparison failure.                                                   |
| Expected tactics                       | Future Lean work should use explicit structures, field/projection equalities, constructor-based proofs, local case splits and finite matrix entry proofs; avoid broad simp/simpa collapse and opaque native__decide goals. |
| Expected mathlib imports               | Reference candidates only: Mathlib.Algebra.Quaternion, Mathlib.Analysis.Quaternion, Mathlib.LinearAlgebra.CliffordAlgebra.Basic. Verify against the pinned Lean/mathlib snapshot before any implementation.                |
| ExecComplex/computable plan            | No ExecComplex object introduced. If finite numeric checks are later needed, keep them mirror/diagnostic unless an exact CNNA-derived computable path is proved.                                                           |
| Concrete computable instance traversal | Concrete traversal currently consists of source equation/profile extraction and target-object registration; no CNNA runtime traversal yet.                                                                                 |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Computable path non-skeleton status  | Reference skeleton only. It must not be presented as computable CNNA evidence until future exact instances are constructed.                                                                                                                                                                                                                                                                                    |
| Expected executable witness          | For V1.25: generated TSV/TEX/PDF artifacts. Future Lean witness: explicit comparison structure instantiated from CNNA-derived objects.                                                                                                                                                                                                                                                                         |
| Mathlib complication log             | Current web docs indicate available Quaternion and CliffordAlgebra APIs, but the project pin is Lean/mathlib 4.28.0; implementation must recheck exact names and theorem availability.                                                                                                                                                                                                                         |
| Noncomputable boundary audit         | No noncomputable Lean code introduced. Future use of analytic/normed quaternion APIs must be isolated from operational paths unless explicitly allowed.                                                                                                                                                                                                                                                        |
| Mathlib mitigation/refactor layer    | If mathlib Clifford/Quaternion APIs pull noncomputable/classical pressure, keep them in mirror/comparison modules or define a minimal finite target profile instead.                                                                                                                                                                                                                                           |
| Bridge gap status                    | Bridge intentionally open. The external reference describes target shapes; CNNA must derive any matching structure internally before comparison.                                                                                                                                                                                                                                                               |
| Natural backjump/refactor layer      | If the comparison needs missing structure, patch only the earliest natural CNNA layer where that structure is generated, not the comparison/consumer phase.                                                                                                                                                                                                                                                    |
| Implementation prompt contract       | Future implementation prompt must state comparison-only status, predecessor objects, no new generator axioms, no external-theory imports unless pinned and isolated, and exact target equalities/failures.                                                                                                                                                                                                     |
| Global no-go inheritance             | All global no-go guardrails apply, especially derived-only, positive-path-first, patch-at-natural-origin and reference-theory-as-target-only rules.                                                                                                                                                                                                                                                            |
| How implemented                      | Planned reference/target-gate integration only. V1.25 records source reading, object links, proof-dossier placeholders and scratchpad material; no Lean code is implemented.                                                                                                                                                                                                                                   |
| Verification / evidence              | YAML generator validation and generated table/PDF outputs after V1.25 update. No Lean build evidence because no Lean source changed.                                                                                                                                                                                                                                                                           |
| Proof strategy                       | Positive path: wait for the natural CNNA predecessor objects, then encode the smallest comparison profile and prove target equality/failure from CNNA data only.                                                                                                                                                                                                                                               |
| Build result                         | No Lean build run; no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                                                                                                                 |
| Post-implementation plan check       | After any future comparison implementation, record whether the target matched, failed, or required a natural-origin backjump; do not smooth failure into a weakened claim.                                                                                                                                                                                                                                     |
| Artifact packaging rule              | Package YAML, generated tables, generated PDF and report. Do not package external PDFs as generated project truth unless they are user-uploaded source material.                                                                                                                                                                                                                                               |
| Implementation notes                 | External theory is recorded only as comparison material. It may suggest target invariants, sign audits and future checks, but cannot release phases or provide CNNA generators.                                                                                                                                                                                                                                |

### Phase 13.7 – B->A input handoff preparation

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                  | planned                                                                                                                                                                                                                    |
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                               |
| Phase type                             | derivation                                                                                                                                                                                                                 |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                  |
| Title / state                          | B->A input handoff preparation                                                                                                                                                                                             |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.    |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.         |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                          |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                          |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                          |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                          |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                          |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                        |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                       |

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

## Phase 14 – Pillar C OQS consumer roadmap from A regimes and B-compatible interfaces

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | Pillar C OQS consumer roadmap from A regimes and B-compatible interfaces                                                                                                                                                                                              |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                           |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                      |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master.                                                                                                                                                                           |
| Verification / evidence                | Pending;<br>phase is not active.                                                                                                                                                                                                                                      |
| Proof strategy                         | To be specified when this phase becomes active;<br>split into subphases if dependencies are too deep.                                                                                                                                                                 |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 14.1 – C input contract from A regime and complement profile

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #FFB6C1;">R</span>                                                                                                                                                                                                   |

| Implementation status                 | planned                                                                                                                                                                                                                                             |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                           |
| Title / state                         | C input contract from A regime and complement profile                                                                                                                                                                                               |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                             |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                   |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                  |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.            |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                 |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                   |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                   |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |

| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | Finite channel / CP-map profile                                                                                                                                                                                                                                       |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                           |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master.                                                                                                                                                                           |
| Verification / evidence                | Pending;<br>phase is not active.                                                                                                                                                                                                                                      |
| Proof strategy                         | To be specified when this phase becomes active;<br>split into subphases if dependencies are too deep.                                                                                                                                                                 |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Phase 14.3 – Effective dynamics and Lindblad/GKSL gate

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                     |

| Phase status                          | <span style="background-color: #f4cccc;">R</span>                                                                                                                                                                          |
| Context class                         | LeanDerivationPhase                                                                                                                                                                                                        |
| Phase documentation tier              | F1                                                                                                                                                                                                                         |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                             |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                         |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                        |
| Implementation status                 | planned                                                                                                                                                                                                                    |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                               |
| Phase type                            | derivation                                                                                                                                                                                                                 |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                  |
| Title / state                         | Effective dynamics and Lindblad/GKSL gate                                                                                                                                                                                  |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.    |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                          |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.         |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                          |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                          |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                          |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                          |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                          |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 14.4 – Decoherence/noise observables as derived effective quantities

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                          |
| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | Decoherence/noise observables as derived effective quantities                                                                                                                                                                                                         |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                        |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                 |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master.                                                                                                                                                                           |
| Verification / evidence                | Pending;<br>phase is not active.                                                                                                                                                                                                                                      |
| Proof strategy                         | To be specified when this phase becomes active;<br>split into subphases if dependencies are too deep.                                                                                                                                                                 |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 14.5 – C->A input handoff preparation

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |

| Phase documentation tier              | F1                                                                                                                                                                                                                                                  |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                                                      |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                  |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                 |
| Implementation status                 | planned                                                                                                                                                                                                                                             |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                           |
| Title / state                         | C->A input handoff preparation                                                                                                                                                                                                                      |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                             |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                   |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                  |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.            |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                 |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                   |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                   |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                          |
| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | Pillar D spacetime/covariance roadmap                                                                                                                                                                                                                                 |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                        |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                 |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master.                                                                                                                                                                           |
| Verification / evidence                | Pending;<br>phase is not active.                                                                                                                                                                                                                                      |
| Proof strategy                         | To be specified when this phase becomes active;<br>split into subphases if dependencies are too deep.                                                                                                                                                                 |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Phase 15.1 – D input contract from A/C geometry exports

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |

| Implementation status                 | planned                                                                                                                                                                                                                                             |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                           |
| Title / state                         | D input contract from A/C geometry exports                                                                                                                                                                                                          |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                             |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                   |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                  |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                          |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                 |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                   |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                   |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

### Phase 15.2 – Region, localization, and causal-order candidates

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                 | planned                                                                                                                                                                                        |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                          |
| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | Region, localization, and causal-order candidates                                                                                                                                                                                                                     |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                           |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master.                                                                                                                                                                           |
| Verification / evidence                | Pending;<br>phase is not active.                                                                                                                                                                                                                                      |
| Proof strategy                         | To be specified when this phase becomes active;<br>split into subphases if dependencies are too deep.                                                                                                                                                                 |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 15.3 – Metric/coarse-geometry and covariance gates

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |

| Implementation status                 | planned                                                                                                                                                                                                                                             |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                           |
| Title / state                         | Metric/coarse-geometry and covariance gates                                                                                                                                                                                                         |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                             |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                   |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                  |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.            |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                 |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                   |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                   |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                          |
| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | D->A input handoff preparation                                                                                                                                                                                                                                        |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                        |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                 |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master.                                                                                                                                                                           |
| Verification / evidence                | Pending;<br>phase is not active.                                                                                                                                                                                                                                      |
| Proof strategy                         | To be specified when this phase becomes active;<br>split into subphases if dependencies are too deep.                                                                                                                                                                 |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 16 – Pillar E matter and phenomenology roadmap

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |

| Implementation status                 | planned                                                                                                                                                                                                                                             |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                           |
| Title / state                         | Pillar E matter and phenomenology roadmap                                                                                                                                                                                                           |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                             |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                   |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                  |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.            |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                 |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                   |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                   |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                          |
| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | E input contract from A/B/C/D outputs                                                                                                                                                                                                                                 |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                        |
