| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                 |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master.                                                                                                                                                                           |
| Verification / evidence                | Pending;<br>phase is not active.                                                                                                                                                                                                                                      |
| Proof strategy                         | To be specified when this phase becomes active;<br>split into subphases if dependencies are too deep.                                                                                                                                                                 |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 16.2 – Matter sector and internal symmetry candidates

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #FFB6C1; border: 1px solid black; padding: 0 2px;">R</span>                                                                                                                                                          |
| Context class                         | LeanDerivationPhase                                                                                                                                                                                                                                 |
| Phase documentation tier              | F1                                                                                                                                                                                                                                                  |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                                                      |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                  |

| Implementation status                 | planned                                                                                                                                                                                                                                             |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                           |
| Title / state                         | Matter sector and internal symmetry candidates                                                                                                                                                                                                      |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                             |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                   |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                  |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.            |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                 |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                   |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                   |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |

### Phase 16.3 – Observable coupling and phenomenology comparison layer

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                            | comparison                                                                                                                                                                                                              |
| Phase-type-specific contract          | Comparison/secondary phase: record derived-only boundary and prevent comparison targets from becoming CNNA-generative inputs.                                                                                           |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Dependency-depth audit                | Pending. Must be completed before this phase may become active.                                                                                                                                                         |
| Proof rehearsal before implementation | Pending. Must be written before implementation starts.                                                                                                                                                                  |
| Bridge gap status                     | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                   |

### Phase 16.4 – E->A input handoff preparation

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                     |

| Phase status                           | <span style="background-color: #f4cccc; border: 1px solid black; padding: 0 2px;">R</span>                                                                                                                                 |
| Context class                          | LeanDerivationPhase                                                                                                                                                                                                        |
| Phase documentation tier               | F1                                                                                                                                                                                                                         |
| Phase documentation depth requirement  | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                             |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                         |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                        |
| Implementation status                  | planned                                                                                                                                                                                                                    |
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                               |
| Phase type                             | derivation                                                                                                                                                                                                                 |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                  |
| Title / state                          | E->A input handoff preparation                                                                                                                                                                                             |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.    |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                          |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.         |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                          |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                          |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                          |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                          |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                          |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                        |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                       |

|                                   |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|-----------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expected executable witness       | not specified yet                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log          | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit      | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Bridge gap status                 | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer   | Not prepared yet.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Implementation prompt contract    | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Phase 17 – Backreaction roadmap through explicit input handoffs only

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | Backreaction roadmap through explicit input handoffs only                                                                                                                                                                                                             |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                                           |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master.                                                                                                                                                                           |
| Verification / evidence                | Pending;<br>phase is not active.                                                                                                                                                                                                                                      |
| Proof strategy                         | To be specified when this phase becomes active;<br>split into subphases if dependencies are too deep.                                                                                                                                                                 |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 17.1 – B->A backreaction gate

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #FFB6C1;"> </span> <b>R</b>                                                                                                                                                                                          |

| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                           |
| Title / state                         | B->A backreaction gate                                                                                                                                                                                                                              |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                             |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                   |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                  |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.            |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                 |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                   |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                   |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Phase 17.2 – C->A OQS backreaction gate

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | C->A OQS backreaction gate                                                                                                                                                                                                                                            |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                        |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                           |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master.                                                                                                                                                                           |
| Verification / evidence                | Pending;<br>phase is not active.                                                                                                                                                                                                                                      |
| Proof strategy                         | To be specified when this phase becomes active;<br>split into subphases if dependencies are too deep.                                                                                                                                                                 |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Phase 17.3 – D->A spacetime backreaction gate

**Table legend.**   G = green/closed and derived-only;   W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   O = orange/implementable after stated predecessor closure;   Y = yellow/active and implementable now;   R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                     |

| Implementation status                 | planned                                                                                                                                                                                                                    |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                               |
| Phase type                            | derivation                                                                                                                                                                                                                 |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                  |
| Title / state                         | D->A spacetime backreaction gate                                                                                                                                                                                           |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.    |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                          |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.         |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                          |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                          |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                          |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                          |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                          |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Phase 17.4 – E->A matter backreaction gate

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation status                     | red-locked-by-release-policy                                                                                                                                                                                                                                          |
| Phase type                             | derivation                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                                             |
| Title / state                          | E->A matter backreaction gate                                                                                                                                                                                                                                         |
| Preparation workflow                   | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                                               |
| Source-to-CNNA mapping                 | Not prepared yet.                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                                    |
| Phase split decision                   | Not prepared yet.                                                                                                                                                                                                                                                     |
| Positive path plan                     | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check;<br>only then may this phase become yellow or orange. Not prepared yet.                                                                                        |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                 |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                                     |
| Expected tactics                       | Not prepared yet.                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | Not prepared yet.                                                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | Not prepared yet.                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | Pending. Any missing bridge must create or activate the earlier natural source phase.                                                                                                                                                                                 |
| Natural backjump/refactor layer        | Not prepared yet.                                                                                                                                                                                                                                                     |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Not implemented yet. Scratch-pad placeholder generated from the single YAML roadmap master.                                                                                                                                                                           |
| Verification / evidence                | Pending;<br>phase is not active.                                                                                                                                                                                                                                      |
| Proof strategy                         | To be specified when this phase becomes active;<br>split into subphases if dependencies are too deep.                                                                                                                                                                 |
| Build result                           | not run                                                                                                                                                                                                                                                               |
| Post-implementation plan check         | Not available yet.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | Roadmap placeholder;<br>does not assert the target is proven.                                                                                                                                                                                                         |

|                  |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 17.5 – Pre-/post-emergence regime switch for A statements

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |

| Implementation status                 | planned                                                                                                                                                                                                                                             |
| Preparation status                    | red-locked-by-release-policy                                                                                                                                                                                                                        |
| Phase type                            | derivation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Derivation phase: record source objects, definitions, proof target, positive construction path, expected tactics, mathlib imports, concrete computable instance traversal if operational.                                                           |
| Title / state                         | Pre-/post-emergence regime switch for A statements                                                                                                                                                                                                  |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code.                             |
| Source-to-CNNA mapping                | Not prepared yet.                                                                                                                                                                                                                                   |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Pending. Must be completed before this phase may become active.                                  |
| Phase split decision                  | Not prepared yet.                                                                                                                                                                                                                                   |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Not prepared yet.                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.            |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                 |
| Proof rehearsal before implementation | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Pending. Must be written before implementation starts.                                                   |
| Expected tactics                      | Not prepared yet.                                                                                                                                                                                                                                   |
| Expected mathlib imports              | Not prepared yet.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan           | Not prepared yet.                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| Implementation status                  | planned-not-active                                                                                                                                                                                                        |
| Preparation status                     | planned-prepared                                                                                                                                                                                                          |
| Phase type                             | comparison                                                                                                                                                                                                                |
| Phase-type-specific contract           | Comparison/reference phase: records external target criteria and scratchpad information; it cannot supply CNNA premises or release mathematical phases.                                                                   |
| Title / state                          | Geometric and conformal algebra side-comparison register                                                                                                                                                                  |
| Preparation workflow                   | External-source intake as comparison/reference gate with derived-only boundary.                                                                                                                                           |
| Source-to-CNNA mapping                 | Maps GA/CGA to Phase 18 side-comparison, not to Pillar-A/B generators. It may later help organize review questions and diagrams.                                                                                          |
| Dependency-depth audit                 | Depends on GA0-GA5 and future CNNA outputs. It is non-blocking and cannot set spacetime dimension, metric, dynamics or matter.                                                                                            |
| Phase split decision                   | Split into narrow comparison gates so CD, Pillar-B boundary algebra, Dirac/STA and side-comparison targets do not collapse into one ambiguous external-theory phase.                                                      |
| Positive path plan                     | Do not implement proof code yet. Keep target invariants in scratchpad; when predecessor data is closed, add a small neutral comparison API and prove/falsify explicitly.                                                  |
| Module implementation manifest         | No Lean modules in V1.25. Future optional modules must be neutral ReferenceGates/ComparisonGate modules, not phase-named public APIs.                                                                                     |
| Semantic placement decision            | Natural placement is comparison/reference-gate layer, not a foundational CNNA derivation layer.                                                                                                                           |
| Reuse and duplication audit            | Reuses existing CD, Pillar-B and side-comparison umbrella phases; new rows are target-gate refinements, not duplicate derivation phases.                                                                                  |
| Canonical generator policy             | The only generator remains the CNNA Lean/provenance chain. External theory may only define target profiles for later comparison.                                                                                          |
| Module compactness rule                | Keep future comparison APIs small and isolated; no broad GA framework should be introduced before a concrete CNNA-derived comparison need exists.                                                                         |
| Refactor regression protocol           | No Lean refactor in V1.25. Future module changes require import graph check, consumer discipline audit and full local Lean build evidence.                                                                                |
| Refactor migration metrics             | No Lean migration. Future comparison module metrics: declarations added, imports added, consumer count, and target/equality proofs closed.                                                                                |
| Lean/mathlib version policy            | Baseline remains pinned Lean/mathlib snapshot; live documentation is only a source-discovery hint until verified locally against the pin.                                                                                 |
| ExecComplex boundary policy            | Do not replace ExecComplex or CNNA scalar provenance with external complex quaternions or analytic Complex.                                                                                                               |
| Consumer-contract direction            | Comparison consumers may read CNNA-derived outputs; CNNA derivation phases may not consume the comparison profile as a generator.                                                                                         |
| Governance-overhead review             | Added overhead is justified because sign, unit and semantic ambiguities are high-risk; gates are narrow to avoid broad external-theory creep.                                                                             |
| Proof rehearsal before implementation  | Future work prepares generated comparison documents from closed CNNA outputs, then asks whether GA/CGA offers a faithful target representation or only a heuristic analogy.                                               |
| Expected tactics                       | Future Lean work should use explicit structures, field/projection equalities, constructor-based proofs, local case splits and finite matrix entry proofs; avoid broad simp/simpa collapse and opaque native_decide goals. |
| Expected mathlib imports               | Reference candidates only: Mathlib.Algebra.Quaternion, Mathlib.Analysis.Quaternion, Mathlib.LinearAlgebra.CliffordAlgebra.Basic. Verify against the pinned Lean/mathlib snapshot before any implementation.               |
| ExecComplex/computable plan            | No ExecComplex object introduced. If finite numeric checks are later needed, keep them mirror/diagnostic unless an exact CNNA-derived computable path is proved.                                                          |
| Concrete computable instance traversal | Concrete traversal currently consists of source equation/profile extraction and target-object registration; no CNNA runtime traversal yet.                                                                                |
| Computable path non-skeleton status    | Reference skeleton only. It must not be presented as computable CNNA evidence until future exact instances are constructed.                                                                                               |
| Expected executable witness            | For V1.25: generated TSV/TEX/PDF artifacts. Future Lean witness: explicit comparison structure instantiated from CNNA-derived objects.                                                                                    |
| Mathlib complication log               | Current web docs indicate available Quaternion and CliffordAlgebra APIs, but the project pin is Lean/mathlib 4.28.0; implementation must recheck exact names and theorem availability.                                    |
| Noncomputable boundary audit           | No noncomputable Lean code introduced. Future use of analytic/normed quaternion APIs must be isolated from operational paths unless explicitly allowed.                                                                   |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Mathlib mitigation/refactor layer    | If mathlib Clifford/Quaternion APIs pull noncomputable/classical pressure, keep them in mirror/comparison modules or define a minimal finite target profile instead.                                                                                                                                                                                                                                           |
| Bridge gap status                    | Bridge intentionally open. The external reference describes target shapes; CNNA must derive any matching structure internally before comparison.                                                                                                                                                                                                                                                               |
| Natural backjump/refactor layer      | If the comparison needs missing structure, patch only the earliest natural CNNA layer where that structure is generated, not the comparison/consumer phase.                                                                                                                                                                                                                                                    |
| Implementation prompt contract       | Future implementation prompt must state comparison-only status, predecessor objects, no new generator axioms, no external-theory imports unless pinned and isolated, and exact target equalities/failures.                                                                                                                                                                                                     |
| Global no-go inheritance             | All global no-go guardrails apply, especially derived-only, positive-path-first, patch-at-natural-origin and reference-theory-as-target-only rules.                                                                                                                                                                                                                                                            |
| How implemented                      | Planned reference/target-gate integration only. V1.25 records source reading, object links, proof-dossier placeholders and scratchpad material; no Lean code is implemented.                                                                                                                                                                                                                                   |
| Verification / evidence              | YAML generator validation and generated table/PDF outputs after V1.25 update. No Lean build evidence because no Lean source changed.                                                                                                                                                                                                                                                                           |
| Proof strategy                       | Positive path: wait for the natural CNNA predecessor objects, then encode the smallest comparison profile and prove target equality/failure from CNNA data only.                                                                                                                                                                                                                                               |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                                                                                                              |
| Post-implementation plan check       | After any future comparison implementation, record whether the target matched, failed, or required a natural-origin backjump; do not smooth failure into a weakened claim.                                                                                                                                                                                                                                     |
| Artifact packaging rule              | Package YAML, generated tables, generated PDF and report. Do not package external PDFs as generated project truth unless they are user-uploaded source material.                                                                                                                                                                                                                                               |
| Implementation notes                 | External theory is recorded only as comparison material. It may suggest target invariants, sign audits and future checks, but cannot release phases or provide CNNA generators.                                                                                                                                                                                                                                |

| Phase-type-specific contract          | Documentation/comparison phase: keep diagnostic material downstream and non-generative.                                                                                                                                 |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Dependency-depth audit                | Pending. Must include route-dependency audit and module placement check before activation.                                                                                                                              |
| Proof rehearsal before implementation | No Lean proof target initially;<br>proof obligation is negative governance: no diagnostic output may feed back into CNNA generation.                                                                                    |
| Bridge gap status                     | Pending. Any missing lifting theorem or route bridge must create or activate the earlier natural source phase.                                                                                                          |

### Phase 20 – DB-REVIEW main side objective: database-ready CNNA review and documentation structure with immediate expert-review principles

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                                                              |
| Context class                         | DocumentationPhase                                                                                                                                                                             |
| Phase documentation tier              | F1                                                                                                                                                                                             |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                             |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                            |
| Implementation status                 | completed                                                                                                                                                                                      |
| Preparation status                    | completed-governance-rule                                                                                                                                                                      |

|                                        |                                                                                                                                                                                                       |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase type                             | documentation                                                                                                                                                                                         |
| Phase-type-specific contract           | Documentation/tooling governance phase: output is review/query infrastructure, not mathematical derivation.                                                                                           |
| Title / state                          | DB-REVIEW side objective governance row                                                                                                                                                               |
| Preparation workflow                   | DB-REVIEW database-ready documentation and expert-review workflow.                                                                                                                                    |
| Source-to-CNNA mapping                 | Maps documentation/database/review infrastructure to generated-secondary metadata only. It cannot supply CNNA-generative mathematical or physical inputs.                                             |
| Dependency-depth audit                 | No Lean dependency introduced. Depends on YAML master and generated views only.                                                                                                                       |
| Phase split decision                   | Split into immediate principles (20.1) and later technical/database/review phases (20.2-20.5).                                                                                                        |
| Positive path plan                     | Apply expert-review/no-infallibility principles immediately;<br>later add schema/export/review tooling without touching Lean truth semantics.                                                         |
| Module implementation manifest         | No Lean module manifest change. Future DB/export scripts require separate manifest if implemented.                                                                                                    |
| Semantic placement decision            | DB-REVIEW belongs to documentation/review/tooling infrastructure, not to Pillar-A mathematical derivation.                                                                                            |
| Reuse and duplication audit            | Reuse Single-YAML-Master and existing generator/export seams;<br>do not create a second authoritative planning source.                                                                                |
| Canonical generator policy             | YAML remains the manual planning source;<br>generated DB/TSV/PDF/graph views remain secondary and reproducible.                                                                                       |
| Module compactness rule                | Keep Lean implementation packets compact;<br>DB/audit-full exploration must not overload routine code-writing phases.                                                                                 |
| Refactor regression protocol           | No Lean refactor. Future tooling must preserve generated-view reproducibility and YAML single-source rule.                                                                                            |
| Refactor migration metrics             | No declaration migration;<br>no imports changed;<br>no Lean modules moved.                                                                                                                            |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                    |
| ExecComplex boundary policy            | No ExecComplex change. Operational scalar boundaries remain governed by EXEC-2 when relevant.                                                                                                         |
| Consumer-contract direction            | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.                                                                              |
| Governance-overhead review             | DB-REVIEW is non-blocking for Lean coding;<br>principles are mandatory, but technical DB work must remain compact and phase-bound.                                                                    |
| Proof rehearsal before implementation  | For completed governance rows, validation is generator/YAML consistency and explicit guardrails. Future rows must rehearse schema round-trip and no-generator boundary.                               |
| Expected tactics                       | None;<br>documentation/tooling phase, not Lean proof phase.                                                                                                                                           |
| Expected mathlib imports               | None added.                                                                                                                                                                                           |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                         |
| Concrete computable instance traversal | Not an operational Lean computation. Concrete traversal is metadata path: YAML row -> generated TSV/TeX/PDF -> future DB row/view.                                                                    |
| Computable path non-skeleton status    | non-operational metadata path;<br>no computable CNNA object claimed                                                                                                                                   |
| Expected executable witness            | For future DB phases: reproducible export/round-trip script output, not a Lean mathematical witness.                                                                                                  |
| Mathlib complication log               | None;<br>no mathlib imports or Lean code changes.                                                                                                                                                     |
| Noncomputable boundary audit           | No noncomputable Lean boundary involved;<br>semantic review is a documentation governance rule.                                                                                                       |
| Mathlib mitigation/refactor layer      | Not applicable unless future Lean-readable metadata tooling is added;<br>then isolate outside operational path.                                                                                       |
| Bridge gap status                      | No mathematical bridge closed. Review gaps and missing blue marks remain explicit audit debt.                                                                                                         |
| Natural backjump/refactor layer        | If a future view needs semantic truth not present in Lean/YAML metadata, backjump to the relevant Lean/object proof source, not to the database/view consumer.                                        |
| Implementation prompt contract         | For future DB-REVIEW phases: preserve Lean-primary/generated-secondary semantics, keep expert review mandatory, and do not turn established theory or database views into CNNA inputs.                |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                           |
| How implemented                        | Added as a main side objective in the YAML phase DAG with direct DBR0 object and child phases 20.1-20.5. Technical database work remains later/non-blocking, but review principles apply immediately. |
| Verification / evidence                | YAML contains Phase 20, DBR0 proof dossier, SLTG-06, GNG23-GNG24, DB-REVIEW workflow, and generated exports/tables.                                                                                   |

|                                      |                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof strategy                       | Governance/documentation proof: preserve Lean-primary/generated-secondary boundary and explicit review obligations.                                                                                                                                                                                                                                       |
| Build result                         | No Lean build run;<br>no Lean source changed. Generator/PDF regeneration only.                                                                                                                                                                                                                                                                            |
| Post-implementation plan check       | Completed rows changed YAML/generator views only. Future rows must record schema/export artifacts, review status coverage, and no Lean-source mutation unless explicitly requested.                                                                                                                                                                       |
| Artifact packaging rule              | Return a complete zip with the updated YAML, generated tables/exports, report, and PDF when applicable. Do not claim Lean build success unless actually run.                                                                                                                                                                                              |
| Implementation notes                 | Side objective is closed as a governance/roadmap insertion, not as a database implementation.                                                                                                                                                                                                                                                             |

### Phase 20.1 – Immediate epistemic expert-review rule and no-infallibility maxim

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                                                              |
| Context class                         | DocumentationPhase                                                                                                                                                                             |
| Phase documentation tier              | F1                                                                                                                                                                                             |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |

|                                        |                                                                                                                                                                                        |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Preparation status                     | completed-governance-rule                                                                                                                                                              |
| Phase type                             | documentation                                                                                                                                                                          |
| Phase-type-specific contract           | Documentation/tooling governance phase: output is review/query infrastructure, not mathematical derivation.                                                                            |
| Title / state                          | Immediate expert-review and no-infallibility rule                                                                                                                                      |
| Preparation workflow                   | DB-REVIEW database-ready documentation and expert-review workflow.                                                                                                                     |
| Source-to-CNNA mapping                 | Maps documentation/database/review infrastructure to generated-secondary metadata only. It cannot supply CNNA-generative mathematical or physical inputs.                              |
| Dependency-depth audit                 | No Lean dependency introduced. Depends on YAML master and generated views only.                                                                                                        |
| Phase split decision                   | Split into immediate principles (20.1) and later technical/database/review phases (20.2-20.5).                                                                                         |
| Positive path plan                     | Apply expert-review/no-infallibility principles immediately;<br>later add schema/export/review tooling without touching Lean truth semantics.                                          |
| Module implementation manifest         | No Lean module manifest change. Future DB/export scripts require separate manifest if implemented.                                                                                     |
| Semantic placement decision            | DB-REVIEW belongs to documentation/review/tooling infrastructure, not to Pillar-A mathematical derivation.                                                                             |
| Reuse and duplication audit            | Reuse Single-YAML-Master and existing generator/export seams;<br>do not create a second authoritative planning source.                                                                 |
| Canonical generator policy             | YAML remains the manual planning source;<br>generated DB/TSV/PDF/graph views remain secondary and reproducible.                                                                        |
| Module compactness rule                | Keep Lean implementation packets compact;<br>DB/audit-full exploration must not overload routine code-writing phases.                                                                  |
| Refactor regression protocol           | No Lean refactor. Future tooling must preserve generated-view reproducibility and YAML single-source rule.                                                                             |
| Refactor migration metrics             | No declaration migration;<br>no imports changed;<br>no Lean modules moved.                                                                                                             |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                     |
| ExecComplex boundary policy            | No ExecComplex change. Operational scalar boundaries remain governed by EXEC-2 when relevant.                                                                                          |
| Consumer-contract direction            | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.                                                               |
| Governance-overhead review             | DB-REVIEW is non-blocking for Lean coding;<br>principles are mandatory, but technical DB work must remain compact and phase-bound.                                                     |
| Proof rehearsal before implementation  | For completed governance rows, validation is generator/YAML consistency and explicit guardrails. Future rows must rehearse schema round-trip and no-generator boundary.                |
| Expected tactics                       | None;<br>documentation/tooling phase, not Lean proof phase.                                                                                                                            |
| Expected mathlib imports               | None added.                                                                                                                                                                            |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                          |
| Concrete computable instance traversal | Not an operational Lean computation. Concrete traversal is metadata path: YAML row -> generated TSV/TeX/PDF -> future DB row/view.                                                     |
| Computable path non-skeleton status    | non-operational metadata path;<br>no computable CNNA object claimed                                                                                                                    |
| Expected executable witness            | For future DB phases: reproducible export/round-trip script output, not a Lean mathematical witness.                                                                                   |
| Mathlib complication log               | None;<br>no mathlib imports or Lean code changes.                                                                                                                                      |
| Noncomputable boundary audit           | No noncomputable Lean boundary involved;<br>semantic review is a documentation governance rule.                                                                                        |
| Mathlib mitigation/refactor layer      | Not applicable unless future Lean-readable metadata tooling is added;<br>then isolate outside operational path.                                                                        |
| Bridge gap status                      | No mathematical bridge closed. Review gaps and missing blue marks remain explicit audit debt.                                                                                          |
| Natural backjump/refactor layer        | If a future view needs semantic truth not present in Lean/YAML metadata, backjump to the relevant Lean/object proof source, not to the database/view consumer.                         |
| Implementation prompt contract         | For future DB-REVIEW phases: preserve Lean-primary/generated-secondary semantics, keep expert review mandatory, and do not turn established theory or database views into CNNA inputs. |

|                                      |                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                     |
| How implemented                      | Added GNG23-GNG24 and DBR1 to enforce Lean-primary/generated-secondary semantics, no 100-percent truth declaration, expert review, and blue/reference audit debt.                                                                                                                                                                               |
| Verification / evidence              | YAML contains GNG23-GNG24, DBR1 proof dossier, review/audit status legend rows, and latest-change overview entry.                                                                                                                                                                                                                               |
| Proof strategy                       | Governance/documentation proof: preserve Lean-primary/generated-secondary boundary and explicit review obligations.                                                                                                                                                                                                                             |
| Build result                         | No Lean build run;<br>no Lean source changed. Generator/PDF regeneration only.                                                                                                                                                                                                                                                                  |
| Post-implementation plan check       | Completed rows changed YAML/generator views only. Future rows must record schema/export artifacts, review status coverage, and no Lean-source mutation unless explicitly requested.                                                                                                                                                             |
| Artifact packaging rule              | Return a complete zip with the updated YAML, generated tables/exports, report, and PDF when applicable. Do not claim Lean build success unless actually run.                                                                                                                                                                                    |
| Implementation notes                 | Principle applies immediately to every future phase, proof dossier, generated view, and theory/reference marking.                                                                                                                                                                                                                               |

### Phase 20.2 – Master-YAML database schema preparation and round-trip-safe identifiers

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field        | Record |
|--------------|--------|
| Phase status | W      |

|                                        |                                                                                                                                                                                                |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Context class                          | ToolInfrastructurePhase                                                                                                                                                                        |
| Phase documentation tier               | F1                                                                                                                                                                                             |
| Phase documentation depth requirement  | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |

| Implementation status                  | planned                                                                                                                                                                                        |
| Preparation status                     | planned                                                                                                                                                                                        |
| Phase type                             | infrastructure                                                                                                                                                                                 |
| Phase-type-specific contract           | Documentation/tooling governance phase: output is review/query infrastructure, not mathematical derivation.                                                                                    |
| Title / state                          | Database schema and round-trip preparation                                                                                                                                                     |
| Preparation workflow                   | DB-REVIEW database-ready documentation and expert-review workflow.                                                                                                                             |
| Source-to-CNNA mapping                 | Maps documentation/database/review infrastructure to generated-secondary metadata only. It cannot supply CNNA-generative mathematical or physical inputs.                                      |
| Dependency-depth audit                 | Future phase must audit YAML fields, generated exports, IDs, references, and review links before implementation.                                                                               |
| Phase split decision                   | Split into immediate principles (20.1) and later technical/database/review phases (20.2-20.5).                                                                                                 |
| Positive path plan                     | Apply expert-review/no-infallibility principles immediately;<br>later add schema/export/review tooling without touching Lean truth semantics.                                                  |
| Module implementation manifest         | No Lean module manifest change. Future DB/export scripts require separate manifest if implemented.                                                                                             |
| Semantic placement decision            | DB-REVIEW belongs to documentation/review/tooling infrastructure, not to Pillar-A mathematical derivation.                                                                                     |
| Reuse and duplication audit            | Reuse Single-YAML-Master and existing generator/export seams;<br>do not create a second authoritative planning source.                                                                         |
| Canonical generator policy             | YAML remains the manual planning source;<br>generated DB/TSV/PDF/graph views remain secondary and reproducible.                                                                                |
| Module compactness rule                | Keep Lean implementation packets compact;<br>DB/audit-full exploration must not overload routine code-writing phases.                                                                          |
| Refactor regression protocol           | No Lean refactor. Future tooling must preserve generated-view reproducibility and YAML single-source rule.                                                                                     |
| Refactor migration metrics             | No declaration migration;<br>no imports changed;<br>no Lean modules moved.                                                                                                                     |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                             |
| ExecComplex boundary policy            | No ExecComplex change. Operational scalar boundaries remain governed by EXEC-2 when relevant.                                                                                                  |
| Consumer-contract direction            | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.                                                                       |
| Governance-overhead review             | DB-REVIEW is non-blocking for Lean coding;<br>principles are mandatory, but technical DB work must remain compact and phase-bound.                                                             |
| Proof rehearsal before implementation  | For completed governance rows, validation is generator/YAML consistency and explicit guardrails. Future rows must rehearse schema round-trip and no-generator boundary.                        |
| Expected tactics                       | None;<br>documentation/tooling phase, not Lean proof phase.                                                                                                                                    |
| Expected mathlib imports               | None added.                                                                                                                                                                                    |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                  |
| Concrete computable instance traversal | Not an operational Lean computation. Concrete traversal is metadata path: YAML row -> generated TSV/TeX/PDF -> future DB row/view.                                                             |
| Computable path non-skeleton status    | non-operational metadata path;<br>no computable CNNA object claimed                                                                                                                            |
| Expected executable witness            | For future DB phases: reproducible export/round-trip script output, not a Lean mathematical witness.                                                                                           |
| Mathlib complication log               | None;<br>no mathlib imports or Lean code changes.                                                                                                                                              |
| Noncomputable boundary audit           | No noncomputable Lean boundary involved;<br>semantic review is a documentation governance rule.                                                                                                |
| Mathlib mitigation/refactor layer      | Not applicable unless future Lean-readable metadata tooling is added;<br>then isolate outside operational path.                                                                                |

|                                      |                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bridge gap status                    | No mathematical bridge closed. Review gaps and missing blue marks remain explicit audit debt.                                                                                                                                                                                                                                                             |
| Natural backjump/refactor layer      | If a future view needs semantic truth not present in Lean/YAML metadata, backjump to the relevant Lean/object proof source, not to the database/view consumer.                                                                                                                                                                                            |
| Implementation prompt contract       | For future DB-REVIEW phases: preserve Lean-primary/generated-secondary semantics, keep expert review mandatory, and do not turn established theory or database views into CNNA inputs.                                                                                                                                                                    |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                               |
| How implemented                      | Not implemented yet. Planned documentation/tooling phase;<br>no Lean source change is authorized by this row.                                                                                                                                                                                                                                             |
| Verification / evidence              | Pending future phase activation. Current evidence is the V1.07 YAML registration and generated planning views only.                                                                                                                                                                                                                                       |
| Proof strategy                       | Future documentation/tooling proof: verify metadata-only status, round-trip integrity, and no CNNA-generative role.                                                                                                                                                                                                                                       |
| Post-implementation plan check       | Completed rows changed YAML/generator views only. Future rows must record schema/export artifacts, review status coverage, and no Lean-source mutation unless explicitly requested.                                                                                                                                                                       |
| Artifact packaging rule              | Return a complete zip with the updated YAML, generated tables/exports, report, and PDF when applicable. Do not claim Lean build success unless actually run.                                                                                                                                                                                              |
| Implementation notes                 | Future database/schema phase. Must preserve YAML as manual source and Lean as primary truth system.                                                                                                                                                                                                                                                       |

| No-go guardrails                     | <ul style="list-style-type: none"> <li>• GLOBAL-INHERITED: all global_no_go_guardrails apply, especially GNG23 and GNG24.</li> <li>• no 100-percent truth declaration</li> <li>• no generated artifact as semantic certificate</li> <li>• no ignored missing blue/reference-theory marking</li> <li>• no database/view layer as CNNA generator</li> </ul> |
| Reusable existing modules            | <ul style="list-style-type: none"> <li>• Repository/scripts/generate_tables.py</li> <li>• Repository/generated_exports/*.tsv</li> <li>• Repository/tables/*.tex</li> </ul>                                                                                                                                                                                |
| Duplicate-risk symbols or operations | <ul style="list-style-type: none"> <li>• second-source-of-truth risk</li> <li>• generated-view-as-truth risk</li> <li>• unmarked-established-theory risk</li> </ul>                                                                                                                                                                                       |

### Phase 20.3 – Discipline-separated expert-review matrix

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field         | Record             |
|---------------|--------------------|
| Phase status  | W                  |
| Context class | DocumentationPhase |

|                                        |                                                                                                                                                                         |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase documentation tier               | F3                                                                                                                                                                      |
| Phase documentation depth requirement  | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                               |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                      |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                     |
| Implementation status                  | planned                                                                                                                                                                 |
| Preparation status                     | planned                                                                                                                                                                 |
| Phase type                             | documentation                                                                                                                                                           |
| Phase-type-specific contract           | Documentation/tooling governance phase: output is review/query infrastructure, not mathematical derivation.                                                             |
| Title / state                          | Discipline-separated expert-review matrix                                                                                                                               |
| Preparation workflow                   | DB-REVIEW database-ready documentation and expert-review workflow.                                                                                                      |
| Source-to-CNNA mapping                 | Maps documentation/database/review infrastructure to generated-secondary metadata only. It cannot supply CNNA-generative mathematical or physical inputs.               |
| Dependency-depth audit                 | Future phase must audit YAML fields, generated exports, IDs, references, and review links before implementation.                                                        |
| Phase split decision                   | Split into immediate principles (20.1) and later technical/database/review phases (20.2-20.5).                                                                          |
| Positive path plan                     | Apply expert-review/no-infallibility principles immediately;<br>later add schema/export/review tooling without touching Lean truth semantics.                           |
| Module implementation manifest         | No Lean module manifest change. Future DB/export scripts require separate manifest if implemented.                                                                      |
| Semantic placement decision            | DB-REVIEW belongs to documentation/review/tooling infrastructure, not to Pillar-A mathematical derivation.                                                              |
| Reuse and duplication audit            | Reuse Single-YAML-Master and existing generator/export seams;<br>do not create a second authoritative planning source.                                                  |
| Canonical generator policy             | YAML remains the manual planning source;<br>generated DB/TSV/PDF/graph views remain secondary and reproducible.                                                         |
| Module compactness rule                | Keep Lean implementation packets compact;<br>DB/audit-full exploration must not overload routine code-writing phases.                                                   |
| Refactor regression protocol           | No Lean refactor. Future tooling must preserve generated-view reproducibility and YAML single-source rule.                                                              |
| Refactor migration metrics             | No declaration migration;<br>no imports changed;<br>no Lean modules moved.                                                                                              |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                      |
| ExecComplex boundary policy            | No ExecComplex change. Operational scalar boundaries remain governed by EXEC-2 when relevant.                                                                           |
| Consumer-contract direction            | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.                                                |
| Governance-overhead review             | DB-REVIEW is non-blocking for Lean coding;<br>principles are mandatory, but technical DB work must remain compact and phase-bound.                                      |
| Proof rehearsal before implementation  | For completed governance rows, validation is generator/YAML consistency and explicit guardrails. Future rows must rehearse schema round-trip and no-generator boundary. |
| Expected tactics                       | None;<br>documentation/tooling phase, not Lean proof phase.                                                                                                             |
| Expected mathlib imports               | None added.                                                                                                                                                             |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                           |
| Concrete computable instance traversal | Not an operational Lean computation. Concrete traversal is metadata path: YAML row -> generated TSV/TeX/PDF -> future DB row/view.                                      |
| Computable path non-skeleton status    | non-operational metadata path;<br>no computable CNNA object claimed                                                                                                     |
| Expected executable witness            | For future DB phases: reproducible export/round-trip script output, not a Lean mathematical witness.                                                                    |
| Mathlib complication log               | None;<br>no mathlib imports or Lean code changes.                                                                                                                       |
| Noncomputable boundary audit           | No noncomputable Lean boundary involved;<br>semantic review is a documentation governance rule.                                                                         |
| Mathlib mitigation/refactor layer      | Not applicable unless future Lean-readable metadata tooling is added;<br>then isolate outside operational path.                                                         |
| Bridge gap status                      | No mathematical bridge closed. Review gaps and missing blue marks remain explicit audit debt.                                                                           |

|                                      |                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Natural backjump/refactor layer      | If a future view needs semantic truth not present in Lean/YAML metadata, backjump to the relevant Lean/object proof source, not to the database/view consumer.                                                                                                                                                                                      |
| Implementation prompt contract       | For future DB-REVIEW phases: preserve Lean-primary/generated-secondary semantics, keep expert review mandatory, and do not turn established theory or database views into CNNA inputs.                                                                                                                                                              |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                         |
| How implemented                      | Not implemented yet. Planned documentation/tooling phase;<br>no Lean source change is authorized by this row.                                                                                                                                                                                                                                       |
| Verification / evidence              | Pending future phase activation. Current evidence is the V1.07 YAML registration and generated planning views only.                                                                                                                                                                                                                                 |
| Proof strategy                       | Future documentation/tooling proof: verify metadata-only status, round-trip integrity, and no CNNA-generative role.                                                                                                                                                                                                                                 |
| Post-implementation plan check       | Completed rows changed YAML/generator views only. Future rows must record schema/export artifacts, review status coverage, and no Lean-source mutation unless explicitly requested.                                                                                                                                                                 |
| Artifact packaging rule              | Return a complete zip with the updated YAML, generated tables/exports, report, and PDF when applicable. Do not claim Lean build success unless actually run.                                                                                                                                                                                        |
| Implementation notes                 | Future review-matrix phase. Must keep review status explicit by discipline and claim/object/phase.                                                                                                                                                                                                                                                  |

Phase 20.4 – Blue/reference-theory marking audit backlog

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                    | Record             |
|--------------------------|--------------------|
| Phase status             | W                  |
| Context class            | DocumentationPhase |
| Phase documentation tier | F3                 |

|                                        |                                                                                                                                                                         |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase documentation depth requirement  | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                               |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                      |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                     |
| Implementation status                  | planned                                                                                                                                                                 |
| Preparation status                     | planned                                                                                                                                                                 |
| Phase type                             | documentation                                                                                                                                                           |
| Phase-type-specific contract           | Documentation/tooling governance phase: output is review/query infrastructure, not mathematical derivation.                                                             |
| Title / state                          | Blue/reference-theory marking audit backlog                                                                                                                             |
| Preparation workflow                   | DB-REVIEW database-ready documentation and expert-review workflow.                                                                                                      |
| Source-to-CNNA mapping                 | Maps documentation/database/review infrastructure to generated-secondary metadata only. It cannot supply CNNA-generative mathematical or physical inputs.               |
| Dependency-depth audit                 | Future phase must audit YAML fields, generated exports, IDs, references, and review links before implementation.                                                        |
| Phase split decision                   | Split into immediate principles (20.1) and later technical/database/review phases (20.2-20.5).                                                                          |
| Positive path plan                     | Apply expert-review/no-infallibility principles immediately;<br>later add schema/export/review tooling without touching Lean truth semantics.                           |
| Module implementation manifest         | No Lean module manifest change. Future DB/export scripts require separate manifest if implemented.                                                                      |
| Semantic placement decision            | DB-REVIEW belongs to documentation/review/tooling infrastructure, not to Pillar-A mathematical derivation.                                                              |
| Reuse and duplication audit            | Reuse Single-YAML-Master and existing generator/export seams;<br>do not create a second authoritative planning source.                                                  |
| Canonical generator policy             | YAML remains the manual planning source;<br>generated DB/TSV/PDF/graph views remain secondary and reproducible.                                                         |
| Module compactness rule                | Keep Lean implementation packets compact;<br>DB/audit-full exploration must not overload routine code-writing phases.                                                   |
| Refactor regression protocol           | No Lean refactor. Future tooling must preserve generated-view reproducibility and YAML single-source rule.                                                              |
| Refactor migration metrics             | No declaration migration;<br>no imports changed;<br>no Lean modules moved.                                                                                              |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                      |
| ExecComplex boundary policy            | No ExecComplex change. Operational scalar boundaries remain governed by EXEC-2 when relevant.                                                                           |
| Consumer-contract direction            | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.                                                |
| Governance-overhead review             | DB-REVIEW is non-blocking for Lean coding;<br>principles are mandatory, but technical DB work must remain compact and phase-bound.                                      |
| Proof rehearsal before implementation  | For completed governance rows, validation is generator/YAML consistency and explicit guardrails. Future rows must rehearse schema round-trip and no-generator boundary. |
| Expected tactics                       | None;<br>documentation/tooling phase, not Lean proof phase.                                                                                                             |
| Expected mathlib imports               | None added.                                                                                                                                                             |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                           |
| Concrete computable instance traversal | Not an operational Lean computation. Concrete traversal is metadata path: YAML row -> generated TSV/TeX/PDF -> future DB row/view.                                      |
| Computable path non-skeleton status    | non-operational metadata path;<br>no computable CNNA object claimed                                                                                                     |
| Expected executable witness            | For future DB phases: reproducible export/round-trip script output, not a Lean mathematical witness.                                                                    |
| Mathlib complication log               | None;<br>no mathlib imports or Lean code changes.                                                                                                                       |
| Noncomputable boundary audit           | No noncomputable Lean boundary involved;<br>semantic review is a documentation governance rule.                                                                         |
| Mathlib mitigation/refactor layer      | Not applicable unless future Lean-readable metadata tooling is added;<br>then isolate outside operational path.                                                         |
| Bridge gap status                      | No mathematical bridge closed. Review gaps and missing blue marks remain explicit audit debt.                                                                           |
| Natural backjump/refactor layer        | If a future view needs semantic truth not present in Lean/YAML metadata, backjump to the relevant Lean/object proof source, not to the database/view consumer.          |

|                                      |                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Implementation prompt contract       | For future DB-REVIEW phases: preserve Lean-primary/generated-secondary semantics, keep expert review mandatory, and do not turn established theory or database views into CNNA inputs.                                                                                                                                                          |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                     |
| How implemented                      | Not implemented yet. Planned documentation/tooling phase;<br>no Lean source change is authorized by this row.                                                                                                                                                                                                                                   |
| Verification / evidence              | Pending future phase activation. Current evidence is the V1.07 YAML registration and generated planning views only.                                                                                                                                                                                                                             |
| Proof strategy                       | Future documentation/tooling proof: verify metadata-only status, round-trip integrity, and no CNNA-generative role.                                                                                                                                                                                                                             |
| Post-implementation plan check       | Completed rows changed YAML/generator views only. Future rows must record schema/export artifacts, review status coverage, and no Lean-source mutation unless explicitly requested.                                                                                                                                                             |
| Artifact packaging rule              | Return a complete zip with the updated YAML, generated tables/exports, report, and PDF when applicable. Do not claim Lean build success unless actually run.                                                                                                                                                                                    |
| Implementation notes                 | Future audit phase. Missing blue markings remain visible audit debt;<br>blue marks comparison/reference only.                                                                                                                                                                                                                                   |
| Source materials / references        | <ul style="list-style-type: none"> <li>user instruction for DB-REVIEW main side objective</li> <li>Single YAML master</li> <li>generated exports/tables</li> <li>object proof dossiers</li> <li>global no-go guardrails</li> </ul>                                                                                                              |

### Phase 20.5 – Interactive/online documentation and database-backed exploration views

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                    | Record                  |
|--------------------------|-------------------------|
| Phase status             | W                       |
| Context class            | ToolInfrastructurePhase |
| Phase documentation tier | F1                      |

|                                        |                                                                                                                                                                                                |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase documentation depth requirement  | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                             |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                            |
| Implementation status                  | planned                                                                                                                                                                                        |
| Preparation status                     | planned                                                                                                                                                                                        |
| Phase type                             | infrastructure                                                                                                                                                                                 |
| Phase-type-specific contract           | Documentation/tooling governance phase: output is review/query infrastructure, not mathematical derivation.                                                                                    |
| Title / state                          | Interactive/online database-backed documentation views                                                                                                                                         |
| Preparation workflow                   | DB-REVIEW database-ready documentation and expert-review workflow.                                                                                                                             |
| Source-to-CNNA mapping                 | Maps documentation/database/review infrastructure to generated-secondary metadata only. It cannot supply CNNA-generative mathematical or physical inputs.                                      |
| Dependency-depth audit                 | Future phase must audit YAML fields, generated exports, IDs, references, and review links before implementation.                                                                               |
| Phase split decision                   | Split into immediate principles (20.1) and later technical/database/review phases (20.2-20.5).                                                                                                 |
| Positive path plan                     | Apply expert-review/no-infallibility principles immediately;<br>later add schema/export/review tooling without touching Lean truth semantics.                                                  |
| Module implementation manifest         | No Lean module manifest change. Future DB/export scripts require separate manifest if implemented.                                                                                             |
| Semantic placement decision            | DB-REVIEW belongs to documentation/review/tooling infrastructure, not to Pillar-A mathematical derivation.                                                                                     |
| Reuse and duplication audit            | Reuse Single-YAML-Master and existing generator/export seams;<br>do not create a second authoritative planning source.                                                                         |
| Canonical generator policy             | YAML remains the manual planning source;<br>generated DB/TSV/PDF/graph views remain secondary and reproducible.                                                                                |
| Module compactness rule                | Keep Lean implementation packets compact;<br>DB/audit-full exploration must not overload routine code-writing phases.                                                                          |
| Refactor regression protocol           | No Lean refactor. Future tooling must preserve generated-view reproducibility and YAML single-source rule.                                                                                     |
| Refactor migration metrics             | No declaration migration;<br>no imports changed;<br>no Lean modules moved.                                                                                                                     |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                             |
| ExecComplex boundary policy            | No ExecComplex change. Operational scalar boundaries remain governed by EXEC-2 when relevant.                                                                                                  |
| Consumer-contract direction            | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.                                                                       |
| Governance-overhead review             | DB-REVIEW is non-blocking for Lean coding;<br>principles are mandatory, but technical DB work must remain compact and phase-bound.                                                             |
| Proof rehearsal before implementation  | For completed governance rows, validation is generator/YAML consistency and explicit guardrails. Future rows must rehearse schema round-trip and no-generator boundary.                        |
| Expected tactics                       | None;<br>documentation/tooling phase, not Lean proof phase.                                                                                                                                    |
| Expected mathlib imports               | None added.                                                                                                                                                                                    |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                  |
| Concrete computable instance traversal | Not an operational Lean computation. Concrete traversal is metadata path: YAML row -> generated TSV/TeX/PDF -> future DB row/view.                                                             |
| Computable path non-skeleton status    | non-operational metadata path;<br>no computable CNNA object claimed                                                                                                                            |
| Expected executable witness            | For future DB phases: reproducible export/round-trip script output, not a Lean mathematical witness.                                                                                           |
| Mathlib complication log               | None;<br>no mathlib imports or Lean code changes.                                                                                                                                              |
| Noncomputable boundary audit           | No noncomputable Lean boundary involved;<br>semantic review is a documentation governance rule.                                                                                                |
| Mathlib mitigation/refactor layer      | Not applicable unless future Lean-readable metadata tooling is added;<br>then isolate outside operational path.                                                                                |
| Bridge gap status                      | No mathematical bridge closed. Review gaps and missing blue marks remain explicit audit debt.                                                                                                  |
| Natural backjump/refactor layer        | If a future view needs semantic truth not present in Lean/YAML metadata, backjump to the relevant Lean/object proof source, not to the database/view consumer.                                 |

|                                      |                                                                                                                                                                                                                                                                                                                                                 |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Implementation prompt contract       | For future DB-REVIEW phases: preserve Lean-primary/generated-secondary semantics, keep expert review mandatory, and do not turn established theory or database views into CNNA inputs.                                                                                                                                                          |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                     |
| How implemented                      | Not implemented yet. Planned documentation/tooling phase;<br>no Lean source change is authorized by this row.                                                                                                                                                                                                                                   |
| Verification / evidence              | Pending future phase activation. Current evidence is the V1.07 YAML registration and generated planning views only.                                                                                                                                                                                                                             |
| Proof strategy                       | Future documentation/tooling proof: verify metadata-only status, round-trip integrity, and no CNNA-generative role.                                                                                                                                                                                                                             |
| Post-implementation plan check       | Completed rows changed YAML/generator views only. Future rows must record schema/export artifacts, review status coverage, and no Lean-source mutation unless explicitly requested.                                                                                                                                                             |
| Artifact packaging rule              | Return a complete zip with the updated YAML, generated tables/exports, report, and PDF when applicable. Do not claim Lean build success unless actually run.                                                                                                                                                                                    |
| Implementation notes                 | Future interactive/online documentation phase. Views remain generated-secondary and may not certify semantic truth.                                                                                                                                                                                                                             |

### Phase 20.6 – Context-filtered documentation slices: all sections retained, only query-relevant rows emitted

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                    |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #c8e6c9;">G</span>                                                                                         |
| Context class                         | GeneratedArtifactPhase                                                                                                                    |
| Phase documentation tier              | F3                                                                                                                                        |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat. |

|                                        |                                                                                                                                                                                                                                     |

| Preparation status                     | completed-tooling-function                                                                                                                                                                                                          |
| Phase type                             | documentation                                                                                                                                                                                                                       |
| Phase-type-specific contract           | Documentation/tooling governance phase: output is review/query infrastructure, not mathematical derivation.                                                                                                                         |
| Title / state                          | Context-filtered documentation slice generator                                                                                                                                                                                      |
| Preparation workflow                   | DB-REVIEW database-ready documentation and expert-review workflow.                                                                                                                                                                  |
| Source-to-CNNA mapping                 | Maps documentation slicing to review/navigation only. Filtered rows may reveal CNNA objects/modules, but the slice itself contributes no CNNA-generative mathematical content.                                                      |
| Dependency-depth audit                 | No Lean dependency introduced. The generator depends only on PyYAML, pdflatex for optional PDF output, the Single-YAML-Master, and generated TSV exports.                                                                           |
| Phase split decision                   | Implemented as a DB-REVIEW tooling phase 20.6 rather than as a Lean/math phase or as a separate authoritative documentation source.                                                                                                 |
| Positive path plan                     | Use context slices for requests such as DtN Matrix documentation and for phase-closeout delta documentation. Future profiles can be added when the vocabulary is curated and auditable.                                             |
| Module implementation manifest         | Added Repository/scripts/generate_context_doc.py. No Lean module manifest change.                                                                                                                                                   |
| Semantic placement decision            | Belongs to DB-REVIEW generated-secondary documentation tooling. It is not a Pillar-A mathematical derivation layer and not a database truth layer.                                                                                  |
| Reuse and duplication audit            | Reuses the Single-YAML-Master and generated_exports. Does not create a second master; output manifest records the source and filter terms.                                                                                          |
| Canonical generator policy             | Context documents are reproducible generated views. Curated profiles live in YAML so they can later round-trip into the database representation.                                                                                    |
| Module compactness rule                | Keeps targeted documentation compact by filtering rows per context while retaining section topology. Reduces overhead during Lean implementation closeouts.                                                                         |
| Refactor regression protocol           | No Lean refactor. Future tooling must preserve generated-view reproducibility and YAML single-source rule.                                                                                                                          |
| Refactor migration metrics             | No declaration migration;<br>no imports changed;<br>no Lean modules moved.                                                                                                                                                          |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                                  |
| ExecComplex boundary policy            | No ExecComplex change. Operational scalar boundaries remain governed by EXEC-2 when relevant.                                                                                                                                       |
| Consumer-contract direction            | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.                                                                                                            |
| Governance-overhead review             | Positive: reduces review overhead by creating small context packets. Risk: filter misses can hide relevant rows; mitigated by manifest terms, hit counts, and expert-review warning.                                                |
| Proof rehearsal before implementation  | Check that every context packet includes all major sections, row counts, source kind, filter terms, manifest, and generated-secondary warning. Do not treat absence of a matched row as proof of irrelevance without expert review. |
| Expected tactics                       | None;<br>Python documentation/tooling phase, not Lean proof phase.                                                                                                                                                                  |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                       |
| Concrete computable instance traversal | Not an operational Lean computation. Concrete traversal is metadata path: YAML row -> generated TSV/TeX/PDF -> future DB row/view.                                                                                                  |
| Computable path non-skeleton status    | non-operational metadata path;<br>no computable CNNA object claimed                                                                                                                                                                 |
| Expected executable witness            | For future DB phases: reproducible export/round-trip script output, not a Lean mathematical witness.                                                                                                                                |
| Mathlib complication log               | None;<br>no mathlib imports or Lean code changes.                                                                                                                                                                                   |
| Noncomputable boundary audit           | No noncomputable Lean boundary involved;<br>semantic review is a documentation governance rule.                                                                                                                                     |
| Mathlib mitigation/refactor layer      | Not applicable unless future Lean-readable metadata tooling is added;<br>then isolate outside operational path.                                                                                                                     |
| Bridge gap status                      | No mathematical bridge closed. Context filtering may expose bridge gaps more efficiently, but every gap remains subject to Lean/object/proof-dossier review.                                                                        |
| Natural backjump/refactor layer        | If a context slice misses relevant content, fix the profile/metadata at the natural documentation schema layer;<br>if the missing content is semantic, backjump to the relevant Lean/object proof source.                           |
| Implementation prompt contract         | For context-doc updates: regenerate tables first, then generate the context slice from YAML/exports;<br>preserve all major sections, include manifest/hit counts, and never claim semantic completeness without expert review.      |

|                                      |                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global no-go inheritance             | yes;<br>all <code>global_no_go_guardrails</code> inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                         |
| How implemented                      | Added <code>scripts/generate_context_doc.py</code> plus <code>context_documentation_profiles</code> . The generator creates query/profile-specific documentation packets with all major sections retained and only context-relevant rows emitted.                                                                                                                |
| Verification / evidence              | Ran <code>scripts/generate_tables.py</code> and <code>scripts/generate_context_doc.py "DtN Matrix" --profile dtn-matrix --slug dtn_matrix</code> . The sample <code>context_docs/dtn_matrix</code> packet contains a manifest, section summary, TeX source, compile log, and PDF if <code>pdflatex</code> succeeds.                                              |
| Proof strategy                       | Tooling proof by reproducible filtering: consume only YAML/export rows, retain section topology, emit filter manifest and hit counts, and state Lean-primary/expert-review warning in every context document.                                                                                                                                                    |
| Build result                         | No Lean build run;<br>no Lean source changed. Python <code>generator/tables/context-doc</code> generation only.                                                                                                                                                                                                                                                  |
| Post-implementation plan check       | V1.08 adds a reusable context-doc generator and a DtN sample packet. Future phase closeouts should use context slices to document changed context instead of forcing full-document review unless a full PDF is explicitly needed.                                                                                                                                |
| Artifact packaging rule              | Return a complete zip with updated YAML, scripts, generated tables/exports, <code>context_docs</code> sample, report, and full PDF when applicable. Do not claim Lean build success unless actually run.                                                                                                                                                         |
| Implementation notes                 | This is a generated-secondary documentation view, not a truth source. It is intended for targeted requests and phase-closeout deltas without regenerating or reading the entire full documentation every time.                                                                                                                                                   |

### Phase 20.7 – Stats front section, tool-interface guiding metaphor, and project licensing notices

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                 |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3; border: 1px solid black; padding: 0 2px;">G</span>                                                                                                                                                             |
| Context class                         | GeneratedArtifactPhase                                                                                                                                                                                                                                 |
| Phase documentation tier              | F3                                                                                                                                                                                                                                                     |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                                                              |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                     |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                    |
| Implementation status                 | completed                                                                                                                                                                                                                                              |
| Preparation status                    | completed-tooling-function                                                                                                                                                                                                                             |
| Phase type                            | documentation                                                                                                                                                                                                                                          |
| Phase-type-specific contract          | Documentation/tooling governance phase: output is review/interface infrastructure, not mathematical derivation.                                                                                                                                        |
| Title / state                         | Stats front section, tool-interface guiding metaphor, and licensing notices                                                                                                                                                                            |
| Preparation workflow                  | DB-REVIEW database-ready documentation and expert-review workflow.                                                                                                                                                                                     |
| Source-to-CNNA mapping                | Maps the analogy to documentation/review practice only: active phase as bright object; rest of Lean code and unaudited semantics as complement; YAML/registers/graphs/database views as interface. No CNNA-generative mathematical data is introduced. |
| Dependency-depth audit                | No Lean dependency introduced. The generator depends on YAML, repo inventory JSON, source-file counts, and existing generated module inventory tables.                                                                                                 |
| Phase split decision                  | Implemented as DB-REVIEW documentation phase 20.7; not a Lean/math phase and not a database implementation phase.                                                                                                                                      |
| Positive path plan                    | Use Stats as a compact orientation surface and the tool-interface metaphor as a reminder that every active phase must expose its boundary, hidden complement risks, blue markings, and expert-review duties.                                           |
| Module implementation manifest        | Modified Repository/scripts/generate_tables.py only; no Lean module manifest change.                                                                                                                                                                   |
| Semantic placement decision           | Belongs to DB-REVIEW generated-secondary documentation tooling. It is not a Pillar-A mathematical derivation layer, not a database truth layer, and not a formal CNNA theorem.                                                                         |
| Reuse and duplication audit           | Reuses the existing module inventory table instead of adding a duplicate standalone module-inventory section. Adds only a generated project_stats view and YAML records for metaphor/license.                                                          |
| Canonical generator policy            | Stats rows are reproducible generated views. Guiding metaphors and license notices live in YAML so they can later round-trip into database views.                                                                                                      |
| Module compactness rule               | Keeps the front section compact: short facts table plus the existing inventory/graph view. Avoids duplicating the old module-inventory section.                                                                                                        |
| Refactor regression protocol          | No Lean refactor. Future tooling must preserve generated-view reproducibility, YAML single-source rule, and old-module-inventory-under-Stats placement.                                                                                                |
| Refactor migration metrics            | No declaration migration; no imports changed; no Lean modules moved.                                                                                                                                                                                   |
| Lean/mathlib version policy           | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                                                     |
| ExecComplex boundary policy           | No ExecComplex change. Operational scalar boundaries remain governed by EXEC-2 when relevant.                                                                                                                                                          |
| Consumer-contract direction           | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.                                                                                                                               |
| Governance-overhead review            | Positive: improves orientation and makes expert-review/no-infallibility context visible at the front. Risk: users may overread the metaphor; mitigated by GNG25 and explicit boundary text.                                                            |
| Proof rehearsal before implementation | Check that Stats uses generated counts, includes the former module inventory/graphs, states licensing, and keeps the metaphor explicitly non-ontological and non-theorematic.                                                                          |
| Expected tactics                      | None; Python documentation/tooling phase, not Lean proof phase.                                                                                                                                                                                        |

|                                        |                                                                                                                                                                                                                                                                                                              |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expected mathlib imports               | None added.                                                                                                                                                                                                                                                                                                  |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                                                                                |
| Concrete computable instance traversal | Not an operational Lean computation. Concrete traversal is metadata path: <code>YAML/repo inventory/source counts</code> -> generated TSV/TeX/PDF -> future database view.                                                                                                                                   |
| Computable path non-skeleton status    | non-operational metadata path;<br>no computable CNNA object claimed                                                                                                                                                                                                                                          |
| Expected executable witness            | <code>project_stats.generated.tsv</code> and the front Stats PDF section, not a Lean mathematical witness.                                                                                                                                                                                                   |
| Mathlib complication log               | None;<br>no mathlib imports or Lean code changes.                                                                                                                                                                                                                                                            |
| Noncomputable boundary audit           | No noncomputable Lean boundary involved;<br>semantic review is a documentation governance rule.                                                                                                                                                                                                              |
| Mathlib mitigation/refactor layer      | Not applicable unless future Lean-readable metadata tooling is added;<br>then isolate outside operational path.                                                                                                                                                                                              |
| Bridge gap status                      | No mathematical bridge closed. The interface metaphor may help reveal bridge gaps, but it cannot close them.                                                                                                                                                                                                 |
| Natural backjump/refactor layer        | If Stats counts are wrong, fix the repository-inventory/generator layer. If the metaphor is misused as a theorem or ontology, enforce GNG25 and correct the documentation layer.                                                                                                                             |
| Implementation prompt contract         | For future front-documentation edits: keep Stats compact;<br>embed generated module inventory under Stats;<br>avoid duplicate standalone sections;<br>keep Lean-primary/expert-review/no-infallibility warnings active.                                                                                      |
| Global no-go inheritance               | yes;<br>all <code>global_no_go_guardrails</code> inherited (GNG01-GNG25)                                                                                                                                                                                                                                     |
| How implemented                        | Added <code>guiding_metaphors</code> and <code>license_notice</code> records to the Single-YAML-Master. Extended <code>scripts/generate_tables.py</code> to compute <code>project_stats.generated.tsv</code> and render a front Stats section that embeds the former module inventory and derivation graphs. |
| Verification / evidence                | Run <code>scripts/generate_tables.py</code> , compile the V1.09 full PDF, and spot-render opening pages to verify that Stats appears at the beginning, the old standalone module-inventory section is removed, and module inventory content is retained under Stats.                                         |
| Proof strategy                         | Tooling proof by reproducible rendering: project facts are computed from <code>YAML/repo-inventory/source</code> files;<br>the old module inventory is included under Stats;<br>the guiding metaphor is explicitly bounded as review architecture only;<br>license notices are concise scope records.        |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table generation and PDF compilation only.                                                                                                                                                                                                              |
| Post-implementation plan check         | V1.09 makes the document start with project facts and an explicit interface/review frame. Future context-doc and phase-closeout outputs should be able to reuse the same Stats/export data.                                                                                                                  |
| Artifact packaging rule                | Return a complete zip with updated YAML, scripts, generated tables/exports, report, full PDF, and existing context-doc samples when applicable. Do not claim Lean build success unless actually run.                                                                                                         |
| Implementation notes                   | The Stats section is a generated-secondary front surface. It is useful for orientation and review, but it does not certify semantic truth. The tool-interface principle is a Leitmetapher with operative review consequences, not a mathematical CNNA theorem.                                               |

### Phase 20.8 – Root artifact retention and generated-output cleanup policy

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                    |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #90EE90; border: 1px solid black; padding: 0 2px;">G</span>                                                |
| Context class                         | GeneratedArtifactPhase                                                                                                                    |
| Phase documentation tier              | F3                                                                                                                                        |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat. |
| Record change version                 | unchanged-by-V1.01                                                                                                                        |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                       |
| Implementation status                 | completed                                                                                                                                 |
| Preparation status                    | completed-tooling-function                                                                                                                |
| Phase type                            | documentation                                                                                                                             |
| Phase-type-specific contract          | Documentation/tooling governance phase: output is repository hygiene infrastructure, not mathematical derivation.                         |
| Title / state                         | Root artifact retention and generated-output cleanup policy                                                                               |
| Preparation workflow                  | Root artifact retention and generated-output cleanup workflow.                                                                            |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source-to-CNNA mapping                 | Maps repository hygiene to Lean-primary/generated-secondary discipline: artifacts that can be regenerated are not CNNA truth sources; archived reports are trace records; YAML/code remain maintained sources.                                                                                                                                                                                    |
| Dependency-depth audit                 | No Lean dependency introduced. Tool dependencies are Python stdlib, PyYAML already used by generate_tables.py, and optional pdflatex for full documentation generation.                                                                                                                                                                                                                           |
| Phase split decision                   | Implemented as DB-REVIEW documentation/tooling phase 20.8, not as a Lean refactor and not as a database implementation phase.                                                                                                                                                                                                                                                                     |
| Positive path plan                     | Keep the root clean before returning to the active content path. Future phase closeouts should generate context docs or full docs only on demand and avoid accumulating root artifacts.                                                                                                                                                                                                           |
| Module implementation manifest         | Added two Python tool scripts only; no Lean module manifest change.                                                                                                                                                                                                                                                                                                                               |
| Semantic placement decision            | Belongs to DB-REVIEW generated-secondary documentation/tooling. It is a retention policy, not a Pillar-A mathematical derivation layer.                                                                                                                                                                                                                                                           |
| Reuse and duplication audit            | Reuses existing generation pipeline; avoids duplicating versioned full-doc TeX/PDF in root. Adds a single canonical full-document generator path.                                                                                                                                                                                                                                                 |
| Canonical generator policy             | Full document TeX/PDF must be generated from YAML/tables by script and treated as disposable unless explicitly requested as an external artifact.                                                                                                                                                                                                                                                 |
| Module compactness rule                | Reduces package clutter and clarifies active source boundaries without changing Lean source structure.                                                                                                                                                                                                                                                                                            |
| Refactor regression protocol           | No Lean refactor. Verify source/control files remain, reports are archived, and root generated artifacts are absent after cleanup.                                                                                                                                                                                                                                                                |
| Refactor migration metrics             | No declaration migration; no imports changed; no Lean modules moved. Root report files moved to archive/reports; root generated PDFs/TeX/build products removed.                                                                                                                                                                                                                                  |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                                                                                                                                                                                                |
| ExecComplex boundary policy            | No ExecComplex change.                                                                                                                                                                                                                                                                                                                                                                            |
| Consumer-contract direction            | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.                                                                                                                                                                                                                                                                          |
| Governance-overhead review             | Positive: reduces root clutter and prevents generated artifacts from being mistaken for sources. Risk: losing convenient PDFs; mitigated by explicit regeneration script and context-documentation workflow.                                                                                                                                                                                      |
| Proof rehearsal before implementation  | Run root audit, add generator/cleanup scripts, regenerate tables, optionally compile full PDF outside root, execute cleanup, and verify root artifact invariants.                                                                                                                                                                                                                                 |
| Expected tactics                       | None; Python/documentation-tooling phase, not Lean proof phase.                                                                                                                                                                                                                                                                                                                                   |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                                                                                                                                                                                       |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Not an operational Lean computation. Concrete traversal is filesystem classification: root artifacts -> archive or delete -> regenerate on demand.                                                                                                                                                                                                                                                |
| Computable path non-skeleton status    | non-operational metadata/tooling path; no computable CNNA object claimed                                                                                                                                                                                                                                                                                                                          |
| Expected executable witness            | scripts/generate_full_document.py, scripts/clean_generated_root_artifacts.py, root cleanup report JSON, and absence of root PDF/TeX artifacts after cleanup.                                                                                                                                                                                                                                      |
| Mathlib complication log               | None; no mathlib imports or Lean code changes.                                                                                                                                                                                                                                                                                                                                                    |
| Noncomputable boundary audit           | No noncomputable Lean boundary involved; only generated documentation artifacts are classified.                                                                                                                                                                                                                                                                                                   |
| Mathlib mitigation/refactor layer      | Not applicable.                                                                                                                                                                                                                                                                                                                                                                                   |
| Bridge gap status                      | No mathematical bridge closed. The bridge here is toolchain hygiene between YAML source data and disposable generated outputs.                                                                                                                                                                                                                                                                    |
| Natural backjump/refactor layer        | If root artifacts reappear, fix release packaging/cleanup workflow, not the Lean source tree. If a report becomes source-like, promote its content into YAML rather than keeping it as an active root Markdown file.                                                                                                                                                                              |
| Implementation prompt contract         | For future packaging: do not retain full PDFs/TeX in root; archive reports; keep README in root; regenerate documentation on demand from YAML/tables/scripts.                                                                                                                                                                                                                                     |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG27)                                                                                                                                                                                                                                                                                                                                          |
| How implemented                        | Audited V1.12 project-root artifacts, added GNG27/SCF46/DBR8, introduced scripts/generate_full_document.py for disposable full-document generation under generated_docs/full/, introduced scripts/clean_generated_root_artifacts.py for root cleanup, and moved historical Markdown reports to archive/reports/ while removing root PDF/TeX/LaTeX build products.                                 |
| Verification / evidence                | Root extension audit before cleanup found 36 Markdown reports, 20 PDFs, 20 TeX files, 19 aux files, 22 logs, 8 out files, 11 toc files and latexmk artifacts. V1.13 validates YAML, regenerates tables/exports, compiles an optional full document under generated_docs/full/, then verifies the packaged root has README.md as the only Markdown file and no root PDF/TeX/LaTeX build artifacts. |

|                                      |                                                                                                                                                                                                                                                                                                                |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof strategy                       | Classify root files by epistemic role: source/control files stay active; generated full-doc PDFs/TeX and LaTeX byproducts are disposable; historical Markdown reports are archived for traceability. Preserve regeneration commands instead of retaining rendered artifacts.                                   |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table generation and optional PDF compilation only.                                                                                                                                                                                                       |
| Post-implementation plan check       | V1.13 makes generated documentation disposable and root hygiene explicit. The active cursor remains 1.1.1.1.5.                                                                                                                                                                                                 |
| Artifact packaging rule              | Return a complete zip with YAML, scripts, tables/exports, repo inventory, repo snapshot, archived reports, and no retained root PDF/TeX/LaTeX byproducts unless the user explicitly asks for a PDF deliverable.                                                                                                |
| Implementation notes                 | This is repository hygiene, not CNNA mathematics. PDFs/TeX are disposable because they can be regenerated from YAML/tables/scripts. Markdown reports are archival evidence and should not crowd the active root or be mistaken for authoritative sources.                                                      |

### Phase 20.9 – Current README and workflow-orientation manual

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                         |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;"> </span> <b>G</b>                                                                                                                     |
| Context class                         | GeneratedArtifactPhase                                                                                                                                                         |
| Phase documentation tier              | F3                                                                                                                                                                             |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                      |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                             |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                            |
| Implementation status                 | completed                                                                                                                                                                      |
| Preparation status                    | completed-tooling-documentation                                                                                                                                                |
| Phase type                            | documentation                                                                                                                                                                  |
| Phase-type-specific contract          | Documentation phase: clarify current tool use, commands, workflow contract, and epistemic status without changing Lean semantics.                                              |
| Title / state                         | Current README and workflow-orientation manual                                                                                                                                 |
| Preparation workflow                  | README/workflow-orientation update workflow.                                                                                                                                   |
| Source-to-CNNA mapping                | Maps the tool workflow to an interface layer over Lean-primary code and generated-secondary documentation without creating a CNNA mathematical input.                          |
| Dependency-depth audit                | No Lean dependency introduced. Documentation commands depend on Python scripts and optional pdflatex only.                                                                     |
| Phase split decision                  | Implemented as DB-REVIEW documentation/tooling phase 20.9, not as a Lean implementation phase and not as database implementation.                                              |
| Positive path plan                    | Use the new README as root entry point before returning to the active 1.1.1.1.5 module-consolidation gate and then 1.1.1.2.                                                    |
| Module implementation manifest        | No Lean modules added/modified. Documentation files only: README.md and V1_14 report; YAML metadata/governance records updated.                                                |
| Semantic placement decision           | Natural placement is DB-REVIEW side objective because this is a documentation/workflow entry-surface update.                                                                   |
| Reuse and duplication audit           | Reuses existing scripts and generated views; no new generator required.                                                                                                        |
| Canonical generator policy            | README documents existing canonical generators instead of creating alternative documentation sources.                                                                          |
| Module compactness rule               | Keep README compact and current; place detailed history in archive/reports or generated docs.                                                                                  |
| Refactor regression protocol          | No Lean refactor. Regression check is generate_tables.py plus root cleanliness and README content audit.                                                                       |
| Refactor migration metrics            | No declaration/module migration; no Lean imports changed.                                                                                                                      |
| Lean/mathlib version policy           | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                             |
| ExecComplex boundary policy           | No ExecComplex change or consumption.                                                                                                                                          |
| Consumer-contract direction           | Human/tooling consumers only. No pillar handoff or mathematical consumer rights are granted.                                                                                   |
| Governance-overhead review            | Positive: replaces chronologically bloated README with a compact current manual. Risk: README could drift; mitigated by keeping source of truth in YAML and generated exports. |
| Proof rehearsal before implementation | Read current README, replace with compact manual, update master records, regenerate tables, verify root cleanliness and absence of Lean changes.                               |
| Expected tactics                      | None; documentation-tooling phase, not Lean proof phase.                                                                                                                       |
| Expected mathlib imports              | None added.                                                                                                                                                                    |

|                                        |                                                                                                                                                                                                                                                                        |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                                          |
| Concrete computable instance traversal | No mathematical traversal;<br>documentation-tooling surface only.                                                                                                                                                                                                      |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>README documents tool commands only.                                                                                                                                                                                       |
| Expected executable witness            | Successful Python generation of tables/exports;<br>no Lean executable witness required.                                                                                                                                                                                |
| Mathlib complication log               | None;<br>no Lean/mathlib import touched.                                                                                                                                                                                                                               |
| Noncomputable boundary audit           | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                                                                                                        |
| Mathlib mitigation/refactor layer      | Not applicable;<br>documentation tooling only.                                                                                                                                                                                                                         |
| Bridge gap status                      | No mathematical bridge closed. The bridge here is user-facing workflow clarity.                                                                                                                                                                                        |
| Natural backjump/refactor layer        | If README starts accumulating historical release notes again, move history into archive/reports or generated docs;<br>keep README current and compact.                                                                                                                 |
| Implementation prompt contract         | Future tool packages should keep README as a current manual, not a chronological changelog. Assistant workflow claims must match actually tested/developed integrations.                                                                                               |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and root-artifact hygiene.                                                                                                                                                           |
| How implemented                        | Replaced the chronological V1.13 README with a current operational manual covering project facts, truth status, manual documentation generation, context documentation, ChatGPT-assisted workflows, workflow extensibility, repository layout, cleanup, and licensing. |
| Verification / evidence                | README was rewritten directly. YAML metadata, latest-change overview, object register, proof dossier, and scratchpad were updated. generate_tables.py was run successfully. No Lean source was edited.                                                                 |
| Proof strategy                         | Turn README into a stable user manual: current commands first, workflow contract second, history in archive. Preserve the Lean-primary/generated-secondary/expert-review split.                                                                                        |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table generation only.                                                                                                                                                                                            |
| Post-implementation plan check         | V1.14 is a documentation/tooling closeout. Active mathematical/content cursor remains 1.1.1.1.5.                                                                                                                                                                       |
| Artifact packaging rule                | Full updated zip package;<br>no generated full PDF/TeX retained in root.                                                                                                                                                                                               |
| Implementation notes                   | The README explicitly says the integrated assistant workflow was developed and tested with ChatGPT. It does not present Claude as a validated toolchain component.                                                                                                     |

### Phase 20.10 – Root Lean/Lake project-control files and build-entry retention policy

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                     |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                                                          |
| Context class                         | GeneratedArtifactPhase                                                                                                                                                                     |
| Phase documentation tier              | F3                                                                                                                                                                                         |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                  |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                         |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                        |

| Preparation status                    | completed-tooling-function                                                                                                                                                                 |
| Phase type                            | infrastructure                                                                                                                                                                             |
| Phase-type-specific contract          | Infrastructure/tooling phase: preserve build reproducibility while keeping generated documentation disposable.                                                                             |
| Title / state                         | Root Lean/Lake project-control files and build-entry retention policy                                                                                                                      |
| Preparation workflow                  | Root artifact retention and Lean/Lake build-entry preservation workflow.                                                                                                                   |
| Source-to-CNNA mapping                | Maps build reproducibility into DB-REVIEW tooling: root Lean/Lake files are not mathematical CNNA generators, but are required for local verification of the Lean-primary source snapshot. |
| Dependency-depth audit                | No new Lean import dependency inside repo_snapshot/CNNA. Package-root lakefile requires mathlib v4.28.0 and uses Repository/repo_snapshot as srcDir.                                       |
| Phase split decision                  | Implemented as DB-REVIEW tooling phase 20.10, separate from mathematical/content cursor 1.1.1.1.5.                                                                                         |
| Positive path plan                    | Preserve reproducible local build entry before returning to the semantic module consolidation gate and then blue-object ledger work.                                                       |
| Module implementation manifest        | Added package-root Lean/Lake project-control files and amended cleanup script; no Lean modules under repo_snapshot/CNNA changed.                                                           |

|                                        |                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Semantic placement decision            | Natural placement is DB-REVIEW/build-reproducibility tooling at package-root boundary, not a mathematical pillar or CNNA generator.                                                                                                                                                                                                   |
| Reuse and duplication audit            | Root CNNA.lean duplicates the top-level import surface only as compatibility entry;<br>Lake source root remains repo_snapshot via srcDir.                                                                                                                                                                                             |
| Canonical generator policy             | Use existing canonical generators: generate_tables.py for YAML views, cleanup script for root hygiene. No alternate truth source.                                                                                                                                                                                                     |
| Module compactness rule                | Root remains compact: source/control files only, not generated outputs.                                                                                                                                                                                                                                                               |
| Refactor regression protocol           | No Lean refactor. Regression check is root file audit and cleanup keep-list test.                                                                                                                                                                                                                                                     |
| Refactor migration metrics             | No module migration;<br>root entry files added only. Import/declaration graph unchanged.                                                                                                                                                                                                                                              |
| Lean/mathlib version policy            | Root toolchain and manifest retain Lean/mathlib v4.28.0 as supplied.                                                                                                                                                                                                                                                                  |
| ExecComplex boundary policy            | No ExecComplex boundary affected.                                                                                                                                                                                                                                                                                                     |
| Consumer-contract direction            | Human/local-build consumers only;<br>no pillar handoff rights.                                                                                                                                                                                                                                                                        |
| Governance-overhead review             | Positive and low overhead: restores four necessary build-control files while keeping generated artifact clutter out of root.                                                                                                                                                                                                          |
| Proof rehearsal before implementation  | Copy build-control files, amend cleanup keep-list, update docs/YAML, regenerate tables, execute cleanup, verify allowed root set.                                                                                                                                                                                                     |
| Expected tactics                       | None;<br>build/tooling phase, not Lean proof phase.                                                                                                                                                                                                                                                                                   |
| Expected mathlib imports               | No source import added;<br>root lakefile pins mathlib v4.28.0.                                                                                                                                                                                                                                                                        |
| ExecComplex/computable plan            | No ExecComplex path introduced.                                                                                                                                                                                                                                                                                                       |
| Concrete computable instance traversal | Concrete traversal is root file inventory and cleanup classification over the actual package root.                                                                                                                                                                                                                                    |
| Computable path non-skeleton status    | Not an operational CNNA computable path;<br>nevertheless the build-entry files are concrete root files, not placeholders.                                                                                                                                                                                                             |
| Expected executable witness            | Successful Python table generation and root cleanup keep-list test;<br>no Lean executable witness required.                                                                                                                                                                                                                           |
| Mathlib complication log               | No Lean/mathlib source complication introduced;<br>root manifest/toolchain pin supplied build environment.                                                                                                                                                                                                                            |
| Noncomputable boundary audit           | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                                                                                                                                                                       |
| Mathlib mitigation/refactor layer      | If mathlib/toolchain changes later, update root Lean/Lake files and manifest in a separate build-entry phase.                                                                                                                                                                                                                         |
| Bridge gap status                      | No mathematical bridge closed;<br>build reproducibility gap closed.                                                                                                                                                                                                                                                                   |
| Natural backjump/refactor layer        | Root cleanup policy is the natural layer;<br>do not patch packaging ad hoc or hide Lake files under generated folders.                                                                                                                                                                                                                |
| Implementation prompt contract         | Future packages must retain CNNA.lean, lakefile.lean, lake-manifest.json and lean-toolchain in the package root above Repository/. Generated docs remain outside active root unless explicitly requested.                                                                                                                             |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and corrected root artifact policy.                                                                                                                                                                                                                 |
| How implemented                        | Copied the user-provided CNNA.lean, lakefile.lean, lake-manifest.json and lean-toolchain into the package/project root above Repository/;<br>amended the root cleanup script to preserve them;<br>updated README and master records to distinguish Lean/Lake project-control files from disposable generated documentation artifacts. |
| Verification / evidence                | Python table generation succeeds;<br>clean_generated_root_artifacts.py --apply leaves Repository root clean;<br>final package-root audit shows CNNA.lean, lakefile.lean, lake-manifest.json and lean-toolchain present above Repository/ with no package-root PDF/TeX/LaTeX build artifacts.                                          |
| Proof strategy                         | Classify root files by reproducibility role: generated documentation remains disposable;<br>Lean/Lake project-control files are maintained build inputs and must be retained in root.                                                                                                                                                 |
| Build result                           | No Lean build run;<br>no repo_snapshot/CNNA Lean source changed. Python table generation and cleanup-root audit only.                                                                                                                                                                                                                 |
| Post-implementation plan check         | V1.15 restores root build entry. Active mathematical/content cursor remains 1.1.1.1.5.                                                                                                                                                                                                                                                |
| Artifact packaging rule                | Full updated zip package must include package-root Lean/Lake files and no retained package-root PDF/TeX/LaTeX byproducts.                                                                                                                                                                                                             |
| Implementation notes                   | This corrects the V1.14 README-only root invariant. The true package-root invariant is source/control oriented: Lean/Lake build-control files stay;<br>generated docs and historical reports do not. Repository/ remains the tool/documentation workspace.                                                                            |

|                                      |                                                                                                                                                                                                                                                                                            |

Phase 20.11 – Root license, single-root README, credits, and assistant-requirement documentation

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                         |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                           | <span style="background-color: #d9ead3;">G</span>                                                                                                              |
| Context class                          | GeneratedArtifactPhase                                                                                                                                         |
| Phase documentation tier               | F3                                                                                                                                                             |
| Phase documentation depth requirement  | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                      |
| Record change version                  | unchanged-by-V1.01                                                                                                                                             |

| Implementation status                  | completed                                                                                                                                                      |
| Preparation status                     | completed-tooling-documentation                                                                                                                                |
| Phase type                             | documentation                                                                                                                                                  |
| Phase-type-specific contract           | Documentation phase: clarify license, credits, requirements and root entry point without changing Lean semantics.                                              |
| Title / state                          | Root license, single-root README, credits, and assistant-requirement documentation                                                                             |
| Preparation workflow                   | Root license, README and credit-surface workflow.                                                                                                              |
| Source-to-CNNA mapping                 | Maps licensing and assistant-workflow metadata into generated-secondary review tooling;<br>no CNNA mathematical generator is introduced.                       |
| Dependency-depth audit                 | No Lean dependency introduced. PDF generation depends on existing Python scripts and optional pdflatex only.                                                   |
| Phase split decision                   | Implemented as DB-REVIEW tooling phase 20.11 after DBR10 because it modifies package-root release surface and generated documentation metadata.                |
| Positive path plan                     | Return to active 1.1.1.1.5 semantic module consolidation gate after packaging/documentation surface is closed.                                                 |
| Module implementation manifest         | No Lean modules added/modified. Documentation/license/tool scripts and YAML only.                                                                              |
| Semantic placement decision            | Natural placement is DB-REVIEW/root documentation and license surface, not a mathematical pillar or CNNA generator.                                            |
| Reuse and duplication audit            | Closed for README surface: duplicate active README copies removed;<br>license/credits centralized at package root and generated from metadata/table for PDFs.  |
| Canonical generator policy             | PDF credits are generated from metadata;<br>license table remains generated from the Single YAML master.                                                       |
| Module compactness rule                | Keep package root compact and unambiguous: README.md, LICENSE, .gitignore, Lean/Lake files, Repository/.                                                       |
| Refactor regression protocol           | No Lean refactor. Regression checks are generate_tables.py, PDF compile, and README-location audit.                                                            |
| Refactor migration metrics             | No Lean module migration;<br>removed duplicate README files only. Import/declaration graph unchanged.                                                          |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                             |
| ExecComplex boundary policy            | No ExecComplex boundary affected.                                                                                                                              |
| Consumer-contract direction            | Human/tooling consumers only. No pillar handoff or mathematical consumer rights are granted.                                                                   |
| Governance-overhead review             | Positive and low overhead: one root LICENSE file, one root README, compact metadata rows and generator author fields;<br>no new mathematical phase complexity. |
| Proof rehearsal before implementation  | Patch README/LICENSE/YAML/scripts, remove duplicate README files, regenerate tables, compile PDFs, audit root and README locations.                            |
| Expected tactics                       | None;<br>documentation/tooling phase, not Lean proof phase.                                                                                                    |
| Expected mathlib imports               | None added.                                                                                                                                                    |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                  |
| Concrete computable instance traversal | Concrete traversal is root file inventory, README-location audit, and generated PDF front-matter check.                                                        |

|                                      |                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Computable path non-skeleton status  | Not an operational/computable CNNA path;<br>concrete output is root LICENSE, root README-only invariant and generated PDF credit surface.                                                                                                                                                                                                                              |
| Expected executable witness          | Successful Python table generation and PDF compilation;<br>no Lean executable witness required.                                                                                                                                                                                                                                                                        |
| Mathlib complication log             | No Lean/mathlib source complication introduced;<br>root manifest/toolchain unchanged.                                                                                                                                                                                                                                                                                  |
| Noncomputable boundary audit         | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                                                                                                                                                                                                        |
| Mathlib mitigation/refactor layer    | If toolchain/license boundaries around dependencies change later, update LICENSE and root build-entry records in a separate phase.                                                                                                                                                                                                                                     |
| Bridge gap status                    | No mathematical bridge closed;<br>release/documentation metadata gap closed.                                                                                                                                                                                                                                                                                           |
| Natural backjump/refactor layer      | Root packaging/documentation surface is the natural layer;<br>do not spread README/license authority into subdirectories.                                                                                                                                                                                                                                              |
| Implementation prompt contract       | Future releases must keep README and LICENSE in package root, update PDF credits from metadata, and avoid duplicate active README surfaces.                                                                                                                                                                                                                            |
| Global no-go inheritance             | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and root surface rules.                                                                                                                                                                                                                                                              |
| How implemented                      | Added root LICENSE, removed duplicate README files from subdirectories, updated root README license/workflow sections, updated PDF generators to show Editor and Assistant credits, and recorded the minimum tested ChatGPT Plus/GPT-5.5 setup.                                                                                                                        |
| Verification / evidence              | generate_tables.py succeeds;<br>full PDF and DtN context PDF compile with updated author credits;<br>grep confirms README.md exists only at package root;<br>no Lean source under repo_snapshot/CNNA changed.                                                                                                                                                          |
| Proof strategy                       | Treat root README/LICENSE and PDF credits as source/control documentation metadata;<br>remove duplicate active README surfaces;<br>keep all generated PDFs secondary and disposable.                                                                                                                                                                                   |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table generation and PDF generation only.                                                                                                                                                                                                                                                                         |
| Post-implementation plan check       | V1.17 is a documentation/tooling closeout. Active mathematical/content cursor remains 1.1.1.1.5.                                                                                                                                                                                                                                                                       |
| Artifact packaging rule              | Full updated zip package;<br>README.md and LICENSE at package root;<br>no duplicate README.md under Repository/ or raw export folders.                                                                                                                                                                                                                                 |
| Implementation notes                 | This is a documentation/tooling governance update only. It changes release/package surfaces and generated PDF front matter, not CNNA mathematical content.                                                                                                                                                                                                             |

Phase 20.12 – Section-pagebreak layout for generated full and context PDFs

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                    |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                         |
| Context class                         | GeneratedArtifactPhase                                                                                                                    |
| Phase documentation tier              | F3                                                                                                                                        |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat. |
| Record change version                 | unchanged-by-V1.01                                                                                                                        |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                       |

|                                        |                                                                                                                                                                                                                                               |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Implementation status                  | completed                                                                                                                                                                                                                                     |
| Preparation status                     | completed-tooling-documentation                                                                                                                                                                                                               |
| Phase type                             | documentation                                                                                                                                                                                                                                 |
| Phase-type-specific contract           | Documentation phase: improve PDF navigability without changing Lean semantics or context-filter row selection.                                                                                                                                |
| Title / state                          | Section-pagebreak layout for generated full and context PDFs                                                                                                                                                                                  |
| Preparation workflow                   | Generated PDF section-pagebreak workflow.                                                                                                                                                                                                     |
| Source-to-CNNA mapping                 | Maps a review-layout requirement into generated-secondary tooling;<br>no CNNA mathematical generator is introduced.                                                                                                                           |
| Dependency-depth audit                 | No Lean dependency introduced. TeX generation depends on existing Python scripts and pdflatex with etoolbox package.                                                                                                                          |
| Phase split decision                   | Implemented as DB-REVIEW tooling phase 20.12 after DBR11 because it modifies generated documentation layout rather than mathematical content.                                                                                                 |
| Positive path plan                     | Return to active 1.1.1.1.5 semantic module consolidation gate after layout tooling is closed.                                                                                                                                                 |
| Module implementation manifest         | No Lean modules added/modified. Documentation generator scripts and YAML only.                                                                                                                                                                |
| Semantic placement decision            | Natural placement is DB-REVIEW/documentation generator layer, not a mathematical pillar or CNNA generator.                                                                                                                                    |
| Reuse and duplication audit            | Closed for layout: the pagebreak invariant is centralized in generators and not repeated in disposable outputs.                                                                                                                               |
| Canonical generator policy             | Section-pagebreak behavior is generated from the full/context generator preambles.                                                                                                                                                            |
| Module compactness rule                | Keep the layout behavior centralized in generators rather than duplicated across generated artifacts.                                                                                                                                         |
| Refactor regression protocol           | Regression checks are generate_tables.py, full PDF compile, context PDF compile, generated TeX hook audit, and early-page rendering.                                                                                                          |
| Refactor migration metrics             | No Lean module migration. Generated PDF page count may increase due to section isolation.                                                                                                                                                     |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                                            |
| ExecComplex boundary policy            | No ExecComplex boundary affected.                                                                                                                                                                                                             |
| Consumer-contract direction            | Human/tooling consumers only. No pillar handoff or mathematical consumer rights are granted.                                                                                                                                                  |
| Governance-overhead review             | Low overhead: one generator-level macro in each PDF generator and one tracked documentation object/guardrail.                                                                                                                                 |
| Proof rehearsal before implementation  | Patch generator macros, regenerate tables, compile representative PDFs, render early pages, and audit no Lean source changed.                                                                                                                 |
| Expected tactics                       | None;<br>documentation/tooling phase, not Lean proof phase.                                                                                                                                                                                   |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                                   |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                 |
| Concrete computable instance traversal | Concrete traversal is full-document PDF generation and DtN context-document generation.                                                                                                                                                       |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete output is compiled full/context PDF layout with top-level section starts on new pages.                                                                                                   |
| Expected executable witness            | Successful Python table generation and PDF compilation;<br>no Lean executable witness required.                                                                                                                                               |
| Mathlib complication log               | No Lean/mathlib source complication introduced;<br>root manifest/toolchain unchanged.                                                                                                                                                         |
| Noncomputable boundary audit           | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | If LaTeX package availability becomes an issue, replace etoolbox with an equivalent built-in LaTeX hook in a later tooling phase.                                                                                                             |
| Bridge gap status                      | No mathematical bridge closed;<br>generated documentation layout gap closed.                                                                                                                                                                  |
| Natural backjump/refactor layer        | Documentation generators are the natural layer;<br>do not edit disposable TeX/PDF output manually.                                                                                                                                            |
| Implementation prompt contract         | Future PDF layout changes must be implemented in the generators and tested on full plus context outputs.                                                                                                                                      |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and section-pagebreak invariant rules.                                                                                                                      |
| How implemented                        | Updated the full-document and context-document generators to load etoolbox and prepend clearpage to top-level section commands;<br>removed the old one-off post-TOC clearpage so section starts are governed uniformly by the generator hook. |

|                                      |                                                                                                                                                                                                                                                                                        |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Verification / evidence              | <p>generate_tables.py succeeds;</p> <p>generated full/documentation TeX contains pretocmd section clearpage hook;</p> <p>full PDF and DtN context PDF compile;</p> <p>early pages were rendered for visual sanity;</p> <p>no Lean source under repo_snapshot/CNNA changed.</p>         |
| Proof strategy                       | <p>Treat section pagination as a generator-level invariant;</p> <p>verify by compiling and rendering representative generated PDFs rather than editing disposable PDFs directly.</p>                                                                                                   |
| Build result                         | <p>No Lean build run;</p> <p>no Lean source changed. Python table generation and PDF generation only.</p>                                                                                                                                                                              |
| Post-implementation plan check       | V1.18 is a documentation-layout closeout. Active mathematical/content cursor remains 1.1.1.1.5.                                                                                                                                                                                        |
| Artifact packaging rule              | <p>Full updated zip package;</p> <p>no generated full/context PDFs in root;</p> <p>generated representative PDFs may exist under generated_docs/ or context_docs/.</p>                                                                                                                 |
| Implementation notes                 | This is a layout/readability update for generated-secondary documentation. It does not alter context matching, table generation, Lean source, or CNNA mathematical semantics.                                                                                                          |

### Phase 20.13 – Phase status release semantics: red-by-default for unreleased Lean-derivation phases

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                       |
|---------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                                                            |
| Context class                         | GeneratedArtifactPhase                                                                                                                                                                       |
| Phase documentation tier              | F3                                                                                                                                                                                           |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                    |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                           |

| Preparation status                    | completed-tooling-governance                                                                                                                                                                 |
| Phase type                            | infrastructure                                                                                                                                                                               |
| Phase-type-specific contract          | Infrastructure/status-governance phase: alter planning color semantics and generator validation without changing Lean semantics.                                                             |
| Title / state                         | Phase status release semantics: red-by-default for unreleased Lean-derivation phases                                                                                                         |
| Preparation workflow                  | Phase status release and red-lock workflow.                                                                                                                                                  |
| Source-to-CNNA mapping                | Maps Lean-derived-only partial-order discipline into phase-status governance; no CNNA mathematical generator is introduced.                                                                  |
| Dependency-depth audit                | No Lean dependency introduced. The policy depends on existing proof dossiers/object register and future pre-implementation checks for releases.                                              |
| Phase split decision                  | Implemented as DB-REVIEW/status-governance phase 20.13 after PDF/layout tooling because it changes phase color semantics globally.                                                           |
| Positive path plan                    | Keep 1.1.1.1.5 yellow; after it closes, release 1.1.1.2 only if its prerequisite objects and ledger evidence are explicit. Red derivation phases stay locked until their own release checks. |
| Module implementation manifest        | No Lean modules added/modified. Master YAML and generator validation only.                                                                                                                   |
| Semantic placement decision           | Natural placement is planning/status-governance layer, not a mathematical pillar or CNNA generator.                                                                                          |
| Reuse and duplication audit           | Status policy is centralized in generator validation and master YAML, avoiding per-phase duplicate rules.                                                                                    |
| Canonical generator policy            | generate_tables.py is the canonical validator for status semantics.                                                                                                                          |
| Module compactness rule               | One policy object and guardrail govern all phase statuses; no separate status prose per red phase beyond automatic lock note.                                                                |
| Refactor regression protocol          | No Lean refactor. Regression checks are generate_tables.py, status-count audit, and full/context documentation generation.                                                                   |
| Refactor migration metrics            | Converted 81 phases from W to R. No Lean imports or declarations changed.                                                                                                                    |
| Lean/mathlib version policy           | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                           |
| ExecComplex boundary policy           | No ExecComplex boundary affected.                                                                                                                                                            |
| Consumer-contract direction           | Planning/tooling consumers only. No pillar handoff or mathematical consumer rights are granted.                                                                                              |
| Governance-overhead review            | Necessary: makes missing derivability explicit. Overhead controlled by using phase_type and generator validation instead of manual per-phase prose.                                          |
| Proof rehearsal before implementation | Audit all W phases by phase_type; convert derivation to R; validate unique Y; compile generated views; inspect status counts.                                                                |

|                                        |                                                                                                                                                                                                                                                                   |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expected tactics                       | None;<br>documentation/tooling phase, not Lean proof phase.                                                                                                                                                                                                       |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                                                       |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Concrete traversal is all phase rows and scratchpad phase_type values.                                                                                                                                                                                            |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete output is status conversion plus generator validation.                                                                                                                                                       |
| Expected executable witness            | Successful Python table generation and status-count audit;<br>no Lean executable witness required.                                                                                                                                                                |
| Mathlib complication log               | No Lean/mathlib source complication introduced;<br>root manifest/toolchain unchanged.                                                                                                                                                                             |
| Noncomputable boundary audit           | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                                                                                                   |
| Mathlib mitigation/refactor layer      | Not applicable;<br>status policy only.                                                                                                                                                                                                                            |
| Bridge gap status                      | No mathematical bridge closed;<br>phase-status release semantics closed.                                                                                                                                                                                          |
| Natural backjump/refactor layer        | Status-governance generator/master YAML is the natural layer;<br>do not patch individual consumer phases ad hoc.                                                                                                                                                  |
| Implementation prompt contract         | Future implementation prompts must not start from red derivation phases;<br>first create/close the release proof referencing derived-only Lean objects.                                                                                                           |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and GNG31.                                                                                                                                                                      |
| How implemented                        | Converted 81 W/derivation phases to R, updated status legend, added DBR13/GNG31/SCF50/workflow, and patched generate_tables.py validation so no future derivation phase can remain white.                                                                         |
| Verification / evidence                | generate_tables.py succeeds after conversion;<br>status counts are generated in project stats;<br>full/context documentation can be regenerated from updated tables;<br>no Lean source under repo_snapshot/CNNA changed.                                          |
| Proof strategy                         | Use phase_type as the release gate: derivation phases require derived-only Lean-object release evidence before yellow/orange;<br>non-direct-Lean work remains white if not active/closed.                                                                         |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table generation and PDF generation only.                                                                                                                                                                    |
| Post-implementation plan check         | V1.19 is a status-governance closeout. Active mathematical/content cursor remains 1.1.1.1.5.                                                                                                                                                                      |
| Artifact packaging rule                | Full updated zip package;<br>generated PDFs may exist under generated_docs/context_docs but not in package root.                                                                                                                                                  |
| Implementation notes                   | This is a planning/status-governance update. It does not implement red phases;<br>it locks them until release evidence references prerequisite derived-only Lean objects.                                                                                         |

Phase 20.14 – Static section explanations and module-change manifest appendix semantics

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                    |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3; padding: 0 2px;">G</span>                                                                         |
| Context class                         | GeneratedArtifactPhase                                                                                                                    |
| Phase documentation tier              | F3                                                                                                                                        |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat. |
| Record change version                 | unchanged-by-V1.01                                                                                                                        |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                       |
| Implementation status                 | completed                                                                                                                                 |
| Preparation status                    | completed-tooling-documentation                                                                                                           |
| Phase type                            | documentation                                                                                                                             |
| Phase-type-specific contract          | Documentation phase: clarify section purpose/data source and module-manifest authority without changing Lean semantics.                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title / state                          | Static section explanations and module-change manifest appendix semantics                                                                                                                                                                                                                                                                              |
| Preparation workflow                   | Documentation section explanation and appendix workflow.                                                                                                                                                                                                                                                                                               |
| Source-to-CNNA mapping                 | Maps documentation-readability requirements into generated-secondary tooling; no CNNA mathematical generator is introduced.                                                                                                                                                                                                                            |
| Dependency-depth audit                 | No Lean dependency introduced. Documentation generation depends on existing Python scripts and pdflatex only.                                                                                                                                                                                                                                          |
| Phase split decision                   | Implemented as DB-REVIEW documentation/tooling phase 20.14 after the phase-status release policy because it clarifies how the generated documentation should be read.                                                                                                                                                                                  |
| Positive path plan                     | Return to active 1.1.1.1.5 semantic module consolidation gate after closing documentation readability/authority boundaries.                                                                                                                                                                                                                            |
| Module implementation manifest         | Module manifest remains generated, but is now explained as technical appendix rather than a primary reading table.                                                                                                                                                                                                                                     |
| Semantic placement decision            | Natural placement is DB-REVIEW/documentation generator layer, not a mathematical pillar or CNNA generator.                                                                                                                                                                                                                                             |
| Reuse and duplication audit            | Closed for documentation semantics: primary phase table and module-change appendix roles are separated.                                                                                                                                                                                                                                                |
| Canonical generator policy             | Static section explanations are generated from full/context generator code; dynamic table rows continue to come from Master YAML or generated exports.                                                                                                                                                                                                 |
| Module compactness rule                | Keep static explanations concise and centralized in generators; keep module-change table narrow and appendix-only.                                                                                                                                                                                                                                     |
| Refactor regression protocol           | Regression checks are generate_tables.py, full PDF compile, context PDF compile, generated TeX title/order audit, and representative rendering.                                                                                                                                                                                                        |
| Refactor migration metrics             | No Lean module migration. Full/context PDF page counts may change due to explanation prose.                                                                                                                                                                                                                                                            |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                                                                                                                                                     |
| ExecComplex boundary policy            | No ExecComplex boundary affected.                                                                                                                                                                                                                                                                                                                      |
| Consumer-contract direction            | Human/tooling consumers only. No pillar handoff or mathematical consumer rights are granted.                                                                                                                                                                                                                                                           |
| Governance-overhead review             | Medium but justified: extra static prose reduces user confusion and prevents the module appendix from being read as a second control surface.                                                                                                                                                                                                          |
| Proof rehearsal before implementation  | Patch static prose in generators, regenerate tables, compile representative PDFs, render representative pages, and audit no Lean source changed.                                                                                                                                                                                                       |
| Expected tactics                       | None; documentation/tooling phase, not Lean proof phase.                                                                                                                                                                                                                                                                                               |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                                                                                                                                            |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                                                                                                                          |
| Concrete computable instance traversal | Concrete traversal is full-document PDF generation and DtN context-document generation.                                                                                                                                                                                                                                                                |
| Computable path non-skeleton status    | Not an operational/computable CNNA path; concrete output is compiled full/context PDFs with static explanations and dynamic tables.                                                                                                                                                                                                                    |
| Expected executable witness            | Successful Python table generation and PDF compilation; no Lean executable witness required.                                                                                                                                                                                                                                                           |
| Mathlib complication log               | No Lean/mathlib source complication introduced; root manifest/toolchain unchanged.                                                                                                                                                                                                                                                                     |
| Noncomputable boundary audit           | No Lean source edited; no noncomputable boundary introduced.                                                                                                                                                                                                                                                                                           |
| Mathlib mitigation/refactor layer      | Not applicable.                                                                                                                                                                                                                                                                                                                                        |
| Bridge gap status                      | No mathematical bridge closed; documentation reading-order and authority-boundary gap closed.                                                                                                                                                                                                                                                          |
| Natural backjump/refactor layer        | Documentation generators and table static paragraphs are the natural layer; do not duplicate static explanation prose as dynamic YAML data rows.                                                                                                                                                                                                       |
| Implementation prompt contract         | Future documentation-clarity changes should modify generator-owned static prose and keep data rows generated from YAML/exports.                                                                                                                                                                                                                        |
| Global no-go inheritance               | All global no-go guardrails apply; especially Lean-primary/generated-secondary, red-by-default phase release and module-change appendix rules.                                                                                                                                                                                                         |
| How implemented                        | Updated full-document generator with static source/purpose prose before each major section; updated context-document generator with static per-section explanations and moved the module manifest to a technical appendix; updated module-manifest table paragraph and phase-table rule in generate_tables.py; updated README and Master YAML records. |

|                                      |                                                                                                                                                                                                                                                                                          |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Verification / evidence              | generate_tables.py succeeds;<br>generated full and context TeX include the new appendix title and section explanations;<br>full PDF and DtN context PDF compile;<br>representative pages rendered;<br>no Lean source under repo_snapshot/CNNA changed.                                   |
| Proof strategy                       | Treat section explanations as static generator-owned prose and table rows as dynamic YAML/export data. Verify by regenerating docs and checking the module manifest no longer appears as a main release section.                                                                         |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table generation and PDF generation only.                                                                                                                                                                                           |
| Post-implementation plan check       | V1.20 is a documentation readability/authority-boundary closeout. Active mathematical/content cursor remains 1.1.1.1.5.                                                                                                                                                                  |
| Artifact packaging rule              | Full updated zip package;<br>representative generated docs may exist under generated_docs/ and context_docs/ but not in package root.                                                                                                                                                    |
| Implementation notes                 | This is documentation/tooling semantics only. It clarifies reading order and data provenance without changing any Lean code, status counts, object derivations, or table row generation logic.                                                                                           |

### Phase 20.15 – Supabase/Postgres mirror feasibility and schema design

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                            |
| Implementation status                 | planned-not-active                                                                                                                                                                             |
| Preparation status                    | planned-sidechain                                                                                                                                                                              |
| Phase type                            | infrastructure                                                                                                                                                                                 |
| Phase-type-specific contract          | Infrastructure/tooling phase: database/web-publication planning only, no Lean derivation and no DB truth authority.                                                                            |
| Title / state                         | Supabase/Postgres mirror feasibility and schema design                                                                                                                                         |
| Preparation workflow                  | Supabase public read-only mirror and web-frontend workflow.                                                                                                                                    |
| Source-to-CNNA mapping                | Maps CNNA planning metadata into a public query/visualization layer. It is not a mathematical CNNA input and not a Lean replacement.                                                           |
| Dependency-depth audit                | Depends on stable YAML identifiers, generated exports, repo inventory and root packaging discipline. Does not block active Lean/content pre-code readiness chain.                              |
| Phase split decision                  | Kept as white DB/tooling sidechain phases 20.15-20.20 so DB planning is visible but does not preempt the active 1.1.1.1.5.1 cursor.                                                            |
| Positive path plan                    | Design DB mirror in staged order: schema -> import/roundtrip -> snapshots/checksums -> read-only api views/RLS -> web frontend contract -> later reviewer/admin model.                         |
| Module implementation manifest        | No Lean modules added or modified. Future DB files may live under Repository/database/supabase or Repository/web once activated.                                                               |
| Semantic placement decision           | Natural placement is DB-REVIEW/generated-secondary publication infrastructure, not a CNNA mathematical pillar.                                                                                 |
| Reuse and duplication audit           | Reuse existing YAML/export/context-doc data; do not create a second canonical planning model in DB without roundtrip contract.                                                                 |
| Canonical generator policy            | Supabase data must be generated/imported from Master YAML and generated exports with snapshot_id/hash evidence.                                                                                |
| Module compactness rule               | Keep DB schema normalized and queryable; avoid large JSON blobs/PDFs/ZIPs as primary DB content.                                                                                               |
| Refactor regression protocol          | No Lean refactor. Future DB schema changes must preserve YAML roundtrip and public view compatibility.                                                                                         |
| Refactor migration metrics            | No migration executed. Future metrics: tables imported, rows imported, snapshot hash, RLS test count, anon write-denial tests.                                                                 |
| Lean/mathlib version policy           | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                             |
| ExecComplex boundary policy           | No ExecComplex change.                                                                                                                                                                         |
| Consumer-contract direction           | Consumers are public read-only frontend/API users and internal admin/import tooling only; no pillar handoff or mathematical consumer rights.                                                   |

|                                        |                                                                                                                                                                                                                                                                                                                                                                |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Governance-overhead review             | Planned sidechain is justified by long-term public visualization/query value, but it must remain non-blocking and sparse until YAML/Lean surfaces stabilize.                                                                                                                                                                                                   |
| Proof rehearsal before implementation  | Before activation, rehearse importer locally using a disposable database, check hashes, verify anon read-only views, and prove that every public row traces to a snapshot_id.                                                                                                                                                                                  |
| Expected tactics                       | None;<br>database/tooling phase, not Lean proof phase.                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                                                                                                                                                    |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                                                                                                                                  |
| Concrete computable instance traversal | No live DB traversal yet. Future traversal is YAML/export rows -> normalized Postgres tables -> api.* views -> web frontend.                                                                                                                                                                                                                                   |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete future output is schema/import/view/frontend contract, not a mathematical witness.                                                                                                                                                                                                                        |
| Expected executable witness            | Future activation requires SQL migrations, import script, snapshot hash report, RLS/grant test report and public-view query examples.                                                                                                                                                                                                                          |
| Mathlib complication log               | None;<br>no Lean/mathlib code changes.                                                                                                                                                                                                                                                                                                                         |
| Noncomputable boundary audit           | No Lean noncomputable boundary involved.                                                                                                                                                                                                                                                                                                                       |
| Mathlib mitigation/refactor layer      | Not applicable.                                                                                                                                                                                                                                                                                                                                                |
| Bridge gap status                      | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                                                                                                                                                                                                          |
| Natural backjump/refactor layer        | If DB requirements conflict with YAML schema, patch the YAML/export schema at the natural documentation/tooling layer;<br>do not alter Lean derivations for DB convenience.                                                                                                                                                                                    |
| Implementation prompt contract         | When activated, generate migrations/importer/frontend contracts from this phase. Do not ask for or store service_role keys in chat or repo;<br>use local .env/admin execution.                                                                                                                                                                                 |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and future Supabase read-only guardrails.                                                                                                                                                                                                                                    |
| How implemented                        | Not implemented. V1.22 records the phase as a non-blocking DB/tooling sidechain for future Supabase/Postgres public read-only mirror and web-frontend work.                                                                                                                                                                                                    |
| Verification / evidence                | Planning record only. No live Supabase connection, no DB write, no frontend deployment and no Lean source change were performed in V1.22.                                                                                                                                                                                                                      |
| Proof strategy                         | Planning/governance proof by explicit scope separation: Lean/YAML source -> snapshot/import -> Supabase read-only mirror -> web frontend. DB rows never become truth-source rows.                                                                                                                                                                              |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                                                              |
| Post-implementation plan check         | V1.22 only records the sidechain. Active mathematical/content cursor remains 1.1.1.1.5.1.                                                                                                                                                                                                                                                                      |
| Artifact packaging rule                | Full updated zip package;<br>no secrets, no .env, no live DB credentials, no generated DB dumps with sensitive keys.                                                                                                                                                                                                                                           |
| Implementation notes                   | internal/api/review/admin schema split;<br>minimal tables for db_snapshots, phases, objects, proof_dossiers, guardrails, workflows, modules, declarations, import_edges, phase_object_links, context_profiles, static_findings and reports. This is<br>generated-secondary/publication tooling and cannot release CNNA phases or replace Lean/YAML provenance. |

### Phase 20.16 – YAML/exports to Postgres import and roundtrip contract

**Table legend.**   = green/closed and derived-only;   W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   O = orange/implementable after stated predecessor closure;   Y = yellow/active and implementable now;   R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                              |
| Context class                         | DatabaseMirrorPhase                                                                                                                                                                            |
| Phase documentation tier              | F1                                                                                                                                                                                             |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                             |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                            |
| Implementation status                 | planned-not-active                                                                                                                                                                             |
| Preparation status                    | planned-sidechain                                                                                                                                                                              |
| Phase type                            | infrastructure                                                                                                                                                                                 |
| Phase-type-specific contract          | Infrastructure/tooling phase: database/web-publication planning only, no Lean derivation and no DB truth authority.                                                                            |
| Title / state                         | YAML/exports to Postgres import and roundtrip contract                                                                                                                                         |
| Preparation workflow                  | Supabase public read-only mirror and web-frontend workflow.                                                                                                                                    |
| Source-to-CNNA mapping                | Maps CNNA planning metadata into a public query/visualization layer. It is not a mathematical CNNA input and not a Lean replacement.                                                           |
| Dependency-depth audit                | Depends on stable YAML identifiers, generated exports, repo inventory and root packaging discipline. Does not block active Lean/content pre-code readiness chain.                              |
| Phase split decision                  | Kept as white DB/tooling sidechain phases 20.15-20.20 so DB planning is visible but does not preempt the active 1.1.1.1.5.1 cursor.                                                            |
| Positive path plan                    | Design DB mirror in staged order: schema -> import/roundtrip -> snapshots/checksums -> read-only api views/RLS -> web frontend contract -> later reviewer/admin model.                         |
| Module implementation manifest        | No Lean modules added or modified. Future DB files may live under Repository/database/supabase or Repository/web once activated.                                                               |
| Semantic placement decision           | Natural placement is DB-REVIEW/generated-secondary publication infrastructure, not a CNNA mathematical pillar.                                                                                 |

|                                        |                                                                                                                                                                                                                                                                     |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Reuse and duplication audit            | Reuse existing YAML/export/context-doc data;<br>do not create a second canonical planning model in DB without roundtrip contract.                                                                                                                                   |
| Canonical generator policy             | Supabase data must be generated/imported from Master YAML and generated exports with snapshot_id/hash evidence.                                                                                                                                                     |
| Module compactness rule                | Keep DB schema normalized and queryable;<br>avoid large JSON blobs/PDFs/ZIPs as primary DB content.                                                                                                                                                                 |
| Refactor regression protocol           | No Lean refactor. Future DB schema changes must preserve YAML roundtrip and public view compatibility.                                                                                                                                                              |
| Refactor migration metrics             | No migration executed. Future metrics: tables imported, rows imported, snapshot hash, RLS test count, anon write-denial tests.                                                                                                                                      |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                                                                  |
| ExecComplex boundary policy            | No ExecComplex change.                                                                                                                                                                                                                                              |
| Consumer-contract direction            | Consumers are public read-only frontend/API users and internal admin/import tooling only;<br>no pillar handoff or mathematical consumer rights.                                                                                                                     |
| Governance-overhead review             | Planned sidechain is justified by long-term public visualization/query value, but it must remain non-blocking and sparse until YAML/Lean surfaces stabilize.                                                                                                        |
| Proof rehearsal before implementation  | Before activation, rehearse importer locally using a disposable database, check hashes, verify anon read-only views, and prove that every public row traces to a snapshot_id.                                                                                       |
| Expected tactics                       | None;<br>database/tooling phase, not Lean proof phase.                                                                                                                                                                                                              |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                                       |
| Concrete computable instance traversal | No live DB traversal yet. Future traversal is YAML/export rows -> normalized Postgres tables -> api.* views -> web frontend.                                                                                                                                        |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete future output is schema/import/view/frontend contract, not a mathematical witness.                                                                                                                             |
| Expected executable witness            | Future activation requires SQL migrations, import script, snapshot hash report, RLS/grant test report and public-view query examples.                                                                                                                               |
| Mathlib complication log               | None;<br>no Lean/mathlib code changes.                                                                                                                                                                                                                              |
| Noncomputable boundary audit           | No Lean noncomputable boundary involved.                                                                                                                                                                                                                            |
| Mathlib mitigation/refactor layer      | Not applicable.                                                                                                                                                                                                                                                     |
| Bridge gap status                      | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                                                                                                               |
| Natural backjump/refactor layer        | If DB requirements conflict with YAML schema, patch the YAML/export schema at the natural documentation/tooling layer;<br>do not alter Lean derivations for DB convenience.                                                                                         |
| Implementation prompt contract         | When activated, generate migrations/importer/frontend contracts from this phase. Do not ask for or store service_role keys in chat or repo;<br>use local .env/admin execution.                                                                                      |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and future Supabase read-only guardrails.                                                                                                                                         |
| How implemented                        | Not implemented. V1.22 records the phase as a non-blocking DB/tooling sidechain for future Supabase/Postgres public read-only mirror and web-frontend work.                                                                                                         |
| Verification / evidence                | Planning record only. No live Supabase connection, no DB write, no frontend deployment and no Lean source change were performed in V1.22.                                                                                                                           |
| Proof strategy                         | Planning/governance proof by explicit scope separation: Lean/YAML source -> snapshot/import -> Supabase read-only mirror -> web frontend. DB rows never become truth-source rows.                                                                                   |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                   |
| Post-implementation plan check         | V1.22 only records the sidechain. Active mathematical/content cursor remains 1.1.1.1.5.1.                                                                                                                                                                           |
| Artifact packaging rule                | Full updated zip package;<br>no secrets, no .env, no live DB credentials, no generated DB dumps with sensitive keys.                                                                                                                                                |
| Implementation notes                   | Importer must be local/admin-run with .env secrets, produce import report/checksums, and never require a service_role key in chat or browser. This is generated-secondary/publication tooling and cannot release CNNA phases or replace Lean/YAML provenance.       |

### Phase 20.17 – Append-only snapshot and checksum model

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Context class                         | DatabaseMirrorPhase                                                                                                                                                                            |
| Phase documentation tier              | F1                                                                                                                                                                                             |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                             |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                            |
| Implementation status                 | planned-not-active                                                                                                                                                                             |
| Preparation status                    | planned-sidechain                                                                                                                                                                              |
| Phase type                            | infrastructure                                                                                                                                                                                 |
| Phase-type-specific contract          | Infrastructure/tooling phase: database/web-publication planning only, no Lean derivation and no DB truth authority.                                                                            |

|                                        |                                                                                                                                                                                   |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title / state                          | Append-only snapshot and checksum model                                                                                                                                           |
| Preparation workflow                   | Supabase public read-only mirror and web-frontend workflow.                                                                                                                       |
| Source-to-CNNA mapping                 | Maps CNNA planning metadata into a public query/visualization layer. It is not a mathematical CNNA input and not a Lean replacement.                                              |
| Dependency-depth audit                 | Depends on stable YAML identifiers, generated exports, repo inventory and root packaging discipline. Does not block active Lean/content pre-code readiness chain.                 |
| Phase split decision                   | Kept as white DB/tooling sidechain phases 20.15-20.20 so DB planning is visible but does not preempt the active 1.1.1.1.5.1 cursor.                                               |
| Positive path plan                     | Design DB mirror in staged order: schema -> import/roundtrip -> snapshots/checksums -> read-only api views/RLS -> web frontend contract -> later reviewer/admin model.            |
| Module implementation manifest         | No Lean modules added or modified. Future DB files may live under Repository/database/supabase or Repository/web once activated.                                                  |
| Semantic placement decision            | Natural placement is DB-REVIEW/generated-secondary publication infrastructure, not a CNNA mathematical pillar.                                                                    |
| Reuse and duplication audit            | Reuse existing YAML/export/context-doc data;<br>do not create a second canonical planning model in DB without roundtrip contract.                                                 |
| Canonical generator policy             | Supabase data must be generated/imported from Master YAML and generated exports with snapshot_id/hash evidence.                                                                   |
| Module compactness rule                | Keep DB schema normalized and queryable;<br>avoid large JSON blobs/PDFs/ZIPs as primary DB content.                                                                               |
| Refactor regression protocol           | No Lean refactor. Future DB schema changes must preserve YAML roundtrip and public view compatibility.                                                                            |
| Refactor migration metrics             | No migration executed. Future metrics: tables imported, rows imported, snapshot hash, RLS test count, anon write-denial tests.                                                    |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                |
| ExecComplex boundary policy            | No ExecComplex change.                                                                                                                                                            |
| Consumer-contract direction            | Consumers are public read-only frontend/API users and internal admin/import tooling only;<br>no pillar handoff or mathematical consumer rights.                                   |
| Governance-overhead review             | Planned sidechain is justified by long-term public visualization/query value, but it must remain non-blocking and sparse until YAML/Lean surfaces stabilize.                      |
| Proof rehearsal before implementation  | Before activation, rehearse importer locally using a disposable database, check hashes, verify anon read-only views, and prove that every public row traces to a snapshot_id.     |
| Expected tactics                       | None;<br>database/tooling phase, not Lean proof phase.                                                                                                                            |
| Expected mathlib imports               | None added.                                                                                                                                                                       |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                     |
| Concrete computable instance traversal | No live DB traversal yet. Future traversal is YAML/export rows -> normalized Postgres tables -> api.* views -> web frontend.                                                      |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete future output is schema/import/view/frontend contract, not a mathematical witness.                                           |
| Expected executable witness            | Future activation requires SQL migrations, import script, snapshot hash report, RLS/grant test report and public-view query examples.                                             |
| Mathlib complication log               | None;<br>no Lean/mathlib code changes.                                                                                                                                            |
| Noncomputable boundary audit           | No Lean noncomputable boundary involved.                                                                                                                                          |
| Mathlib mitigation/refactor layer      | Not applicable.                                                                                                                                                                   |
| Bridge gap status                      | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                             |
| Natural backjump/refactor layer        | If DB requirements conflict with YAML schema, patch the YAML/export schema at the natural documentation/tooling layer;<br>do not alter Lean derivations for DB convenience.       |
| Implementation prompt contract         | When activated, generate migrations/importer/frontend contracts from this phase. Do not ask for or store service_role keys in chat or repo;<br>use local .env/admin execution.    |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and future Supabase read-only guardrails.                                                       |
| How implemented                        | Not implemented. V1.22 records the phase as a non-blocking DB/tooling sidechain for future Supabase/Postgres public read-only mirror and web-frontend work.                       |
| Verification / evidence                | Planning record only. No live Supabase connection, no DB write, no frontend deployment and no Lean source change were performed in V1.22.                                         |
| Proof strategy                         | Planning/governance proof by explicit scope separation: Lean/YAML source -> snapshot/import -> Supabase read-only mirror -> web frontend. DB rows never become truth-source rows. |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                 |
| Post-implementation plan check         | V1.22 only records the sidechain. Active mathematical/content cursor remains 1.1.1.1.5.1.                                                                                         |

|                                      |                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Artifact packaging rule              | Full updated zip package;<br>no secrets, no .env, no live DB credentials, no generated DB dumps with sensitive keys.                                                                                                                                                                                    |
| Implementation notes                 | db_snapshots with snapshot_id, tool_version, lean_data_timestamp, yaml_hash, repo_inventory_hash, created_at, created_by, source_zip_name and optional import_report_hash. This is generated-secondary/publication tooling and cannot release CNNA phases or replace Lean/YAML provenance.              |

### Phase 20.18 – Public read-only API views and RLS policies

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field        | Record |
|--------------|--------|
| Phase status | W      |

|                                        |                                                                                                                                                                                                |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Context class                          | DatabaseMirrorPhase                                                                                                                                                                            |
| Phase documentation tier               | F1                                                                                                                                                                                             |
| Phase documentation depth requirement  | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                             |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                            |
| Implementation status                  | planned-not-active                                                                                                                                                                             |
| Preparation status                     | planned-sidechain                                                                                                                                                                              |
| Phase type                             | infrastructure                                                                                                                                                                                 |
| Phase-type-specific contract           | Infrastructure/tooling phase: database/web-publication planning only, no Lean derivation and no DB truth authority.                                                                            |
| Title / state                          | Public read-only API views and RLS policies                                                                                                                                                    |
| Preparation workflow                   | Supabase public read-only mirror and web-frontend workflow.                                                                                                                                    |
| Source-to-CNNA mapping                 | Maps CNNA planning metadata into a public query/visualization layer. It is not a mathematical CNNA input and not a Lean replacement.                                                           |
| Dependency-depth audit                 | Depends on stable YAML identifiers, generated exports, repo inventory and root packaging discipline. Does not block active Lean/content pre-code readiness chain.                              |
| Phase split decision                   | Kept as white DB/tooling sidechain phases 20.15-20.20 so DB planning is visible but does not preempt the active 1.1.1.1.5.1 cursor.                                                            |
| Positive path plan                     | Design DB mirror in staged order: schema -> import/roundtrip -> snapshots/checksums -> read-only api views/RLS -> web frontend contract -> later reviewer/admin model.                         |
| Module implementation manifest         | No Lean modules added or modified. Future DB files may live under Repository/database/supabase or Repository/web once activated.                                                               |
| Semantic placement decision            | Natural placement is DB-REVIEW/generated-secondary publication infrastructure, not a CNNA mathematical pillar.                                                                                 |
| Reuse and duplication audit            | Reuse existing YAML/export/context-doc data;<br>do not create a second canonical planning model in DB without roundtrip contract.                                                              |
| Canonical generator policy             | Supabase data must be generated/imported from Master YAML and generated exports with snapshot_id/hash evidence.                                                                                |
| Module compactness rule                | Keep DB schema normalized and queryable;<br>avoid large JSON blobs/PDFs/ZIPs as primary DB content.                                                                                            |
| Refactor regression protocol           | No Lean refactor. Future DB schema changes must preserve YAML roundtrip and public view compatibility.                                                                                         |
| Refactor migration metrics             | No migration executed. Future metrics: tables imported, rows imported, snapshot hash, RLS test count, anon write-denial tests.                                                                 |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                             |
| ExecComplex boundary policy            | No ExecComplex change.                                                                                                                                                                         |
| Consumer-contract direction            | Consumers are public read-only frontend/API users and internal admin/import tooling only;<br>no pillar handoff or mathematical consumer rights.                                                |
| Governance-overhead review             | Planned sidechain is justified by long-term public visualization/query value, but it must remain non-blocking and sparse until YAML/Lean surfaces stabilize.                                   |
| Proof rehearsal before implementation  | Before activation, rehearse importer locally using a disposable database, check hashes, verify anon read-only views, and prove that every public row traces to a snapshot_id.                  |
| Expected tactics                       | None;<br>database/tooling phase, not Lean proof phase.                                                                                                                                         |
| Expected mathlib imports               | None added.                                                                                                                                                                                    |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                  |
| Concrete computable instance traversal | No live DB traversal yet. Future traversal is YAML/export rows -> normalized Postgres tables -> api.* views -> web frontend.                                                                   |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete future output is schema/import/view/frontend contract, not a mathematical witness.                                                        |
| Expected executable witness            | Future activation requires SQL migrations, import script, snapshot hash report, RLS/grant test report and public-view query examples.                                                          |
| Mathlib complication log               | None;<br>no Lean/mathlib code changes.                                                                                                                                                         |
| Noncomputable boundary audit           | No Lean noncomputable boundary involved.                                                                                                                                                       |
| Mathlib mitigation/refactor layer      | Not applicable.                                                                                                                                                                                |
| Bridge gap status                      | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                                          |
| Natural backjump/refactor layer        | If DB requirements conflict with YAML schema, patch the YAML/export schema at the natural documentation/tooling layer;<br>do not alter Lean derivations for DB convenience.                    |

|                                      |                                                                                                                                                                                                                                                                                                              |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Implementation prompt contract       | When activated, generate migrations/importer/frontend contracts from this phase. Do not ask for or store service_role keys in chat or repo; use local .env/admin execution.                                                                                                                                  |
| Global no-go inheritance             | All global no-go guardrails apply; especially Lean-primary/generated-secondary and future Supabase read-only guardrails.                                                                                                                                                                                     |
| How implemented                      | Not implemented. V1.22 records the phase as a non-blocking DB/tooling sidechain for future Supabase/Postgres public read-only mirror and web-frontend work.                                                                                                                                                  |
| Verification / evidence              | Planning record only. No live Supabase connection, no DB write, no frontend deployment and no Lean source change were performed in V1.22.                                                                                                                                                                    |
| Proof strategy                       | Planning/governance proof by explicit scope separation: Lean/YAML source -> snapshot/import -> Supabase read-only mirror -> web frontend. DB rows never become truth-source rows.                                                                                                                            |
| Build result                         | No Lean build run; no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                               |
| Post-implementation plan check       | V1.22 only records the sidechain. Active mathematical/content cursor remains 1.1.1.1.5.1.                                                                                                                                                                                                                    |
| Artifact packaging rule              | Full updated zip package; no secrets, no .env, no live DB credentials, no generated DB dumps with sensitive keys.                                                                                                                                                                                            |
| Implementation notes                 | anon gets SELECT on api.* views only; no anon INSERT/UPDATE/DELETE; internal.* and admin/import.* remain closed; service_role never appears in frontend/browser. This is generated-secondary/publication tooling and cannot release CNNA phases or replace Lean/YAML provenance.                             |

Phase 20.19 – cnna-project.net web-frontend data contract

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                              |
| Context class                         | DatabaseMirrorPhase                                                                                                                                                                            |
| Phase documentation tier              | F1                                                                                                                                                                                             |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                             |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                            |
| Implementation status                 | planned-not-active                                                                                                                                                                             |
| Preparation status                    | planned-sidechain                                                                                                                                                                              |
| Phase type                            | infrastructure                                                                                                                                                                                 |
| Phase-type-specific contract          | Infrastructure/tooling phase: database/web-publication planning only, no Lean derivation and no DB truth authority.                                                                            |
| Title / state                         | cnna-project.net web-frontend data contract                                                                                                                                                    |
| Preparation workflow                  | Supabase public read-only mirror and web-frontend workflow.                                                                                                                                    |
| Source-to-CNNA mapping                | Maps CNNA planning metadata into a public query/visualization layer. It is not a mathematical CNNA input and not a Lean replacement.                                                           |
| Dependency-depth audit                | Depends on stable YAML identifiers, generated exports, repo inventory and root packaging discipline. Does not block active Lean/content pre-code readiness chain.                              |
| Phase split decision                  | Kept as white DB/tooling sidechain phases 20.15-20.20 so DB planning is visible but does not preempt the active 1.1.1.1.5.1 cursor.                                                            |
| Positive path plan                    | Design DB mirror in staged order: schema -> import/roundtrip -> snapshots/checksums -> read-only api views/RLS -> web frontend contract -> later reviewer/admin model.                         |
| Module implementation manifest        | No Lean modules added or modified. Future DB files may live under Repository/database/supabase or Repository/web once activated.                                                               |
| Semantic placement decision           | Natural placement is DB-REVIEW/generated-secondary publication infrastructure, not a CNNA mathematical pillar.                                                                                 |
| Reuse and duplication audit           | Reuse existing YAML/export/context-doc data;<br>do not create a second canonical planning model in DB without roundtrip contract.                                                              |
| Canonical generator policy            | Supabase data must be generated/imported from Master YAML and generated exports with snapshot_id/hash evidence.                                                                                |
| Module compactness rule               | Keep DB schema normalized and queryable;<br>avoid large JSON blobs/PDFs/ZIPs as primary DB content.                                                                                            |
| Refactor regression protocol          | No Lean refactor. Future DB schema changes must preserve YAML roundtrip and public view compatibility.                                                                                         |
| Refactor migration metrics            | No migration executed. Future metrics: tables imported, rows imported, snapshot hash, RLS test count, anon write-denial tests.                                                                 |
| Lean/mathlib version policy           | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                             |
| ExecComplex boundary policy           | No ExecComplex change.                                                                                                                                                                         |
| Consumer-contract direction           | Consumers are public read-only frontend/API users and internal admin/import tooling only;<br>no pillar handoff or mathematical consumer rights.                                                |
| Governance-overhead review            | Planned sidechain is justified by long-term public visualization/query value, but it must remain non-blocking and sparse until YAML/Lean surfaces stabilize.                                   |
| Proof rehearsal before implementation | Before activation, rehearse importer locally using a disposable database, check hashes, verify anon read-only views, and prove that every public row traces to a snapshot_id.                  |
| Expected tactics                      | None;<br>database/tooling phase, not Lean proof phase.                                                                                                                                         |
| Expected mathlib imports              | None added.                                                                                                                                                                                    |
| ExecComplex/computable plan           | No ExecComplex object introduced or consumed.                                                                                                                                                  |

|                                        |                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Concrete computable instance traversal | No live DB traversal yet. Future traversal is YAML/export rows -> normalized Postgres tables -> api.* views -> web frontend.                                                                                                                                                                                                      |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete future output is schema/import/view/frontend contract, not a mathematical witness.                                                                                                                                                                                           |
| Expected executable witness            | Future activation requires SQL migrations, import script, snapshot hash report, RLS/grant test report and public-view query examples.                                                                                                                                                                                             |
| Mathlib complication log               | None;<br>no Lean/mathlib code changes.                                                                                                                                                                                                                                                                                            |
| Noncomputable boundary audit           | No Lean noncomputable boundary involved.                                                                                                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | Not applicable.                                                                                                                                                                                                                                                                                                                   |
| Bridge gap status                      | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                                                                                                                                                                             |
| Natural backjump/refactor layer        | If DB requirements conflict with YAML schema, patch the YAML/export schema at the natural documentation/tooling layer;<br>do not alter Lean derivations for DB convenience.                                                                                                                                                       |
| Implementation prompt contract         | When activated, generate migrations/importer/frontend contracts from this phase. Do not ask for or store service_role keys in chat or repo;<br>use local .env/admin execution.                                                                                                                                                    |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and future Supabase read-only guardrails.                                                                                                                                                                                                       |
| How implemented                        | Not implemented. V1.22 records the phase as a non-blocking DB/tooling sidechain for future Supabase/Postgres public read-only mirror and web-frontend work.                                                                                                                                                                       |
| Verification / evidence                | Planning record only. No live Supabase connection, no DB write, no frontend deployment and no Lean source change were performed in V1.22.                                                                                                                                                                                         |
| Proof strategy                         | Planning/governance proof by explicit scope separation: Lean/YAML source -> snapshot/import -> Supabase read-only mirror -> web frontend. DB rows never become truth-source rows.                                                                                                                                                 |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                                 |
| Post-implementation plan check         | V1.22 only records the sidechain. Active mathematical/content cursor remains 1.1.1.1.5.1.                                                                                                                                                                                                                                         |
| Artifact packaging rule                | Full updated zip package;<br>no secrets, no .env, no live DB credentials, no generated DB dumps with sensitive keys.                                                                                                                                                                                                              |
| Implementation notes                   | Frontend can query public views with anon/publishable key only and render phase map, object register, red/orange release reasons, import/module graph, proof dossiers, blue-debt dashboard and HTML context docs. This is generated-secondary/publication tooling and cannot release CNNA phases or replace Lean/YAML provenance. |

Phase 20.20 – Reviewer annotation and future admin-write model

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                              |
| Context class                         | DatabaseMirrorPhase                                                                                                                                                                            |
| Phase documentation tier              | F1                                                                                                                                                                                             |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                             |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                            |
| Implementation status                 | planned-not-active                                                                                                                                                                             |
| Preparation status                    | planned-sidechain                                                                                                                                                                              |
| Phase type                            | infrastructure                                                                                                                                                                                 |
| Phase-type-specific contract          | Infrastructure/tooling phase: database/web-publication planning only, no Lean derivation and no DB truth authority.                                                                            |
| Title / state                         | Reviewer annotation and future admin-write model                                                                                                                                               |
| Preparation workflow                  | Supabase public read-only mirror and web-frontend workflow.                                                                                                                                    |
| Source-to-CNNA mapping                | Maps CNNA planning metadata into a public query/visualization layer. It is not a mathematical CNNA input and not a Lean replacement.                                                           |
| Dependency-depth audit                | Depends on stable YAML identifiers, generated exports, repo inventory and root packaging discipline. Does not block active Lean/content pre-code readiness chain.                              |
| Phase split decision                  | Kept as white DB/tooling sidechain phases 20.15-20.20 so DB planning is visible but does not preempt the active 1.1.1.1.5.1 cursor.                                                            |
| Positive path plan                    | Design DB mirror in staged order: schema -> import/roundtrip -> snapshots/checksums -> read-only api views/RLS -> web frontend contract -> later reviewer/admin model.                         |
| Module implementation manifest        | No Lean modules added or modified. Future DB files may live under Repository/database/supabase or Repository/web once activated.                                                               |
| Semantic placement decision           | Natural placement is DB-REVIEW/generated-secondary publication infrastructure, not a CNNA mathematical pillar.                                                                                 |
| Reuse and duplication audit           | Reuse existing YAML/export/context-doc data;<br>do not create a second canonical planning model in DB without roundtrip contract.                                                              |
| Canonical generator policy            | Supabase data must be generated/imported from Master YAML and generated exports with snapshot_id/hash evidence.                                                                                |
| Module compactness rule               | Keep DB schema normalized and queryable;<br>avoid large JSON blobs/PDFs/ZIPs as primary DB content.                                                                                            |
| Refactor regression protocol          | No Lean refactor. Future DB schema changes must preserve YAML roundtrip and public view compatibility.                                                                                         |
| Refactor migration metrics            | No migration executed. Future metrics: tables imported, rows imported, snapshot hash, RLS test count, anon write-denial tests.                                                                 |
| Lean/mathlib version policy           | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                             |

|                                        |                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ExecComplex boundary policy            | No ExecComplex change.                                                                                                                                                                                                                                                                                                 |
| Consumer-contract direction            | Consumers are public read-only frontend/API users and internal admin/import tooling only;<br>no pillar handoff or mathematical consumer rights.                                                                                                                                                                        |
| Governance-overhead review             | Planned sidechain is justified by long-term public visualization/query value, but it must remain non-blocking and sparse until YAML/Lean surfaces stabilize.                                                                                                                                                           |
| Proof rehearsal before implementation  | Before activation, rehearse importer locally using a disposable database, check hashes, verify anon read-only views, and prove that every public row traces to a snapshot_id.                                                                                                                                          |
| Expected tactics                       | None;<br>database/tooling phase, not Lean proof phase.                                                                                                                                                                                                                                                                 |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                                                                                                            |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                                                                                          |
| Concrete computable instance traversal | No live DB traversal yet. Future traversal is YAML/export rows -> normalized Postgres tables -> api.* views -> web frontend.                                                                                                                                                                                           |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete future output is schema/import/view/frontend contract, not a mathematical witness.                                                                                                                                                                                |
| Expected executable witness            | Future activation requires SQL migrations, import script, snapshot hash report, RLS/grant test report and public-view query examples.                                                                                                                                                                                  |
| Mathlib complication log               | None;<br>no Lean/mathlib code changes.                                                                                                                                                                                                                                                                                 |
| Noncomputable boundary audit           | No Lean noncomputable boundary involved.                                                                                                                                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | Not applicable.                                                                                                                                                                                                                                                                                                        |
| Bridge gap status                      | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                                                                                                                                                                  |
| Natural backjump/refactor layer        | If DB requirements conflict with YAML schema, patch the YAML/export schema at the natural documentation/tooling layer;<br>do not alter Lean derivations for DB convenience.                                                                                                                                            |
| Implementation prompt contract         | When activated, generate migrations/importer/frontend contracts from this phase. Do not ask for or store service_role keys in chat or repo;<br>use local .env/admin execution.                                                                                                                                         |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and future Supabase read-only guardrails.                                                                                                                                                                                            |
| How implemented                        | Not implemented. V1.22 records the phase as a non-blocking DB/tooling sidechain for future Supabase/Postgres public read-only mirror and web-frontend work.                                                                                                                                                            |
| Verification / evidence                | Planning record only. No live Supabase connection, no DB write, no frontend deployment and no Lean source change were performed in V1.22.                                                                                                                                                                              |
| Proof strategy                         | Planning/governance proof by explicit scope separation: Lean/YAML source -> snapshot/import -> Supabase read-only mirror -> web frontend. DB rows never become truth-source rows.                                                                                                                                      |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                      |
| Post-implementation plan check         | V1.22 only records the sidechain. Active mathematical/content cursor remains 1.1.1.1.5.1.                                                                                                                                                                                                                              |
| Artifact packaging rule                | Full updated zip package;<br>no secrets, no .env, no live DB credentials, no generated DB dumps with sensitive keys.                                                                                                                                                                                                   |
| Implementation notes                   | review.* for later authenticated comments/annotations;<br>admin/import.* for local importer or future signed Edge Function;<br>no public writes and no manual table-click update as standard workflow. This is generated-secondary/publication tooling and cannot release CNNA phases or replace Lean/YAML provenance. |

Phase 20.21 – Generated PDF typography scale increase

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                    |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                         |
| Context class                         | GeneratedArtifactPhase                                                                                                                    |
| Phase documentation tier              | F3                                                                                                                                        |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat. |
| Record change version                 | unchanged-by-V1.01                                                                                                                        |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                       |
| Implementation status                 | completed                                                                                                                                 |
| Preparation status                    | completed-tooling-documentation                                                                                                           |
| Phase type                            | documentation                                                                                                                             |
| Phase-type-specific contract          | Documentation phase: improve PDF readability without changing Lean semantics, YAML row semantics or context-filter row selection.         |
| Title / state                         | Generated PDF typography scale increase                                                                                                   |
| Preparation workflow                  | Generated PDF typography profile workflow.                                                                                                |
| Source-to-CNNA mapping                | Maps a review-layout/readability requirement into generated-secondary tooling; no CNNA mathematical generator is introduced.              |
| Dependency-depth audit                | No Lean dependency introduced. TeX generation depends on existing Python scripts and pdflatex only.                                       |
| Phase split decision                  | Implemented as DB-REVIEW tooling phase 20.21 because it modifies generated documentation layout rather than mathematical content.         |
| Positive path plan                    | Return to active 1.1.1.1.5.1 IST intake gate after typography tooling is closed.                                                          |

|                                        |                                                                                                                                                                                                                                                                     |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Module implementation manifest         | No Lean modules added/modified. Documentation generator scripts and YAML only.                                                                                                                                                                                      |
| Semantic placement decision            | Natural placement is DB-REVIEW/documentation generator layer, not a mathematical pillar or CNNA generator.                                                                                                                                                          |
| Reuse and duplication audit            | Closed for typography: size profile is centralized in generators and not repeated by manual PDF edits.                                                                                                                                                              |
| Canonical generator policy             | Typography behavior is generated from full/context/table generator source, not from edited PDF files.                                                                                                                                                               |
| Module compactness rule                | Do not split table generators solely for typography;<br>use one central size-bump policy unless later profiles require explicit configuration.                                                                                                                      |
| Refactor regression protocol           | Regression checks are generate_tables.py, full PDF compile, context PDF compile, generated TeX size-profile audit and representative rendering.                                                                                                                     |
| Refactor migration metrics             | No Lean module migration. Generated PDF page count may increase due to larger fonts and wrapping.                                                                                                                                                                   |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                                                                  |
| ExecComplex boundary policy            | No ExecComplex boundary affected.                                                                                                                                                                                                                                   |
| Consumer-contract direction            | Human/tooling consumers only. No pillar handoff or mathematical consumer rights are granted.                                                                                                                                                                        |
| Governance-overhead review             | Low overhead: centralized generator/table size profile;<br>possible downside is increased page count, accepted as readability tradeoff.                                                                                                                             |
| Proof rehearsal before implementation  | Patch generator size profile, regenerate tables, compile representative PDFs, render sample pages, and audit no Lean source changed.                                                                                                                                |
| Expected tactics                       | None;<br>documentation/tooling phase, not Lean proof phase.                                                                                                                                                                                                         |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                                       |
| Concrete computable instance traversal | Concrete traversal is full-document PDF generation and Supabase context-document generation.                                                                                                                                                                        |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete output is compiled full/context PDF layout with enlarged text.                                                                                                                                                 |
| Expected executable witness            | Successful Python table generation and PDF compilation;<br>no Lean executable witness required.                                                                                                                                                                     |
| Mathlib complication log               | No Lean/mathlib source complication introduced;<br>root manifest/toolchain unchanged.                                                                                                                                                                               |
| Noncomputable boundary audit           | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                                                                                                     |
| Mathlib mitigation/refactor layer      | Not applicable;<br>documentation tooling only.                                                                                                                                                                                                                      |
| Bridge gap status                      | No mathematical bridge closed;<br>generated PDF readability/layout gap closed.                                                                                                                                                                                      |
| Natural backjump/refactor layer        | Documentation generators and table generator are the natural layer;<br>do not edit disposable PDFs manually.                                                                                                                                                        |
| Implementation prompt contract         | Future font/layout changes must be encoded as generator profiles and tested on at least one full plus one context PDF.                                                                                                                                              |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and typography profile rules.                                                                                                                                                     |
| How implemented                        | Updated full/context PDF generators to use 11pt A3 landscape document classes;<br>bumped explicit table and legend TeX size commands one step in generate_tables.py;<br>bumped generated graph label sizes where the tool controls DOT output.                      |
| Verification / evidence                | generate_tables.py succeeds;<br>generated full and context PDFs compile;<br>generated TeX contains documentclass[11pt] and larger table-size commands;<br>representative pages were rendered for visual sanity;<br>no Lean source under repo_snapshot/CNNA changed. |
| Proof strategy                         | Treat typography as a generator-level profile;<br>prove by regeneration and render inspection rather than manual PDF editing.                                                                                                                                       |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table generation and PDF generation only.                                                                                                                                                                      |
| Post-implementation plan check         | V1.23 is a documentation-layout closeout. Active mathematical/content cursor remains 1.1.1.1.5.1.                                                                                                                                                                   |

|                                      |                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Artifact packaging rule              | Full updated zip package;<br>no generated full/context PDFs in package root;<br>generated representative PDFs may exist under generated_docs/ or context_docs/.                                                                                                                                                                        |
| Implementation notes                 | This is a generated-secondary readability/layout update only. It may increase PDF page counts and table wrapping, but must not change row content, phase status, context filtering, Lean code or proof semantics.                                                                                                                      |

| Implementation status                  | completed                                                                                                                                                                                                           |
| Preparation status                     | completed-readonly-discovery                                                                                                                                                                                        |
| Phase type                             | infrastructure                                                                                                                                                                                                      |
| Phase-type-specific contract           | Infrastructure/tooling sidechain: Supabase stores generated-secondary planning metadata for public read-only query/visualization; no Lean semantic authority.                                                       |
| Title / state                          | Supabase live project discovery and empty-schema baseline audit                                                                                                                                                     |
| Preparation workflow                   | Supabase live import activation workflow.                                                                                                                                                                           |
| Source-to-CNNA mapping                 | Maps CNNA generated-secondary metadata to Supabase as public query/visualization data. It is not a mathematical CNNA input and not a Lean replacement.                                                              |
| Dependency-depth audit                 | Depends on stable YAML identifiers, generated exports, repo inventory, root packaging discipline, and explicit user authorization for live writes. Does not block the active Lean/content pre-code readiness chain. |
| Phase split decision                   | Existing 20.15-20.20 remain broad contracts; V1.24 adds concrete live-project activation phases after checking those existing phases to avoid scope duplication.                                                    |
| Positive path plan                     | Proceed from read-only baseline -> migration package -> import package -> explicit live execution -> read-only/RLS/frontend verification.                                                                           |
| Module implementation manifest         | No Lean modules. Future DB artifacts may be SQL migrations/import scripts/frontend contract files under Repository/database/supabase.                                                                               |
| Semantic placement decision            | Natural placement is DB-REVIEW/Supabase infrastructure sidechain, not a Lean derivation phase.                                                                                                                      |
| Reuse and duplication audit            | Existing 20.15-20.20 were checked and kept; new phases are concrete activation subchain, not duplicates.                                                                                                            |
| Canonical generator policy             | Supabase rows must be generated from Master YAML/generated_exports/repo_inventory via canonical importer, not manual table edits.                                                                                   |
| Module compactness rule                | Keep DB artifacts isolated under Repository/database/supabase and avoid leaking DB concerns into Lean module names.                                                                                                 |
| Refactor regression protocol           | No Lean refactor. Regression checks are generated tables/PDF, DB schema/import dry-run, live inventory/advisor output after authorized execution.                                                                   |
| Refactor migration metrics             | No Lean module migration. Future DB migration metrics: schemas/tables/views/policies/row counts/import hashes.                                                                                                      |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                  |
| ExecComplex boundary policy            | No ExecComplex boundary affected.                                                                                                                                                                                   |
| Consumer-contract direction            | Consumers are public web/query/review tooling only. No pillar handoff or mathematical consumer rights are granted.                                                                                                  |
| Governance-overhead review             | Moderate but justified: direct DB access now exists, so broad DB phases need concrete activation contracts before any write.                                                                                        |
| Proof rehearsal before implementation  | Dry-run schema/import artifacts, then when authorized apply migration/import, check tables/views, advisor output, anon read-only access and no public writes.                                                       |
| Expected tactics                       | None; database/tooling phase, not Lean proof phase.                                                                                                                                                                 |
| Expected mathlib imports               | None added.                                                                                                                                                                                                         |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                       |
| Concrete computable instance traversal | Concrete traversal is Supabase project discovery, planned schema/import tables, and later live table/view verification.                                                                                             |
| Computable path non-skeleton status    | Not an operational/computable CNNA path; concrete output is DB tooling metadata and later Supabase rows with snapshot provenance.                                                                                   |

|                                      |                                                                                                                                                                                                                                                        |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expected executable witness          | For planning phases: generate_tables.py/PDF generation. For future live phases: migration/import report, row counts, advisor output and read-only test results.                                                                                        |
| Mathlib complication log             | No Lean/mathlib source complication introduced;<br>root manifest/toolchain unchanged.                                                                                                                                                                  |
| Noncomputable boundary audit         | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                                                                                        |
| Mathlib mitigation/refactor layer    | Not applicable;<br>database/tooling layer only.                                                                                                                                                                                                        |
| Bridge gap status                    | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                                                                                                  |
| Natural backjump/refactor layer      | If DB requirements conflict with YAML/export structure, patch the YAML/export schema or DB importer layer;<br>do not alter Lean derivations for DB convenience.                                                                                        |
| Implementation prompt contract       | Future live DB work must be explicit: apply migration/import only after user authorization, write only to Supabase, never edit Lean files, and produce report/checksums/advisor output.                                                                |
| Global no-go inheritance             | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and Supabase public-read-only rules.                                                                                                                                 |
| How implemented                      | Performed read-only Supabase discovery through connected tool: listed organization CNNA Project, project aiekahdewadrejrrdajn in eu-north-1 as ACTIVE_HEALTHY, and confirmed no tables in public/internal/api/review/admin before migration/import.    |
| Verification / evidence              | Supabase list_organizations/list_projects/list_tables read-only calls;<br>no migration, no SQL write, no data import and no Lean source change.                                                                                                        |
| Proof strategy                       | Separate broad DB architecture contracts 20.15-20.20 from concrete live activation phases 20.22-20.26;<br>require snapshot_id, hashes, import reports and explicit authorization for writes.                                                           |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                      |
| Post-implementation plan check       | Supabase DB sidechain remains W/G tooling and does not alter active mathematical/content cursor 1.1.1.1.5.1.                                                                                                                                           |
| Artifact packaging rule              | Package migration/import/frontend-contract artifacts in Repository/database/supabase or reports;<br>do not package secrets, service_role keys or generated DB credentials.                                                                             |
| Implementation notes                 | Supabase/Postgres DB/tooling sidechain only. It writes no Lean files and cannot act as CNNA truth system or phase-release authority.                                                                                                                   |

### Phase 20.23 – Supabase initial schema migration package and RLS/read-only policy design

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                              |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                                                   |
| Context class                         | DatabaseMirrorPhase                                                                                                                                                                                                 |
| Phase documentation tier              | F1                                                                                                                                                                                                                  |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                      |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                  |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                 |
| Implementation status                 | planned-not-active                                                                                                                                                                                                  |
| Preparation status                    | planned-sidechain                                                                                                                                                                                                   |
| Phase type                            | infrastructure                                                                                                                                                                                                      |
| Phase-type-specific contract          | Infrastructure/tooling sidechain: Supabase stores generated-secondary planning metadata for public read-only query/visualization; no Lean semantic authority.                                                       |
| Title / state                         | Supabase initial schema migration package and RLS/read-only policy design                                                                                                                                           |
| Preparation workflow                  | Supabase live import activation workflow.                                                                                                                                                                           |
| Source-to-CNNA mapping                | Maps CNNA generated-secondary metadata to Supabase as public query/visualization data. It is not a mathematical CNNA input and not a Lean replacement.                                                              |
| Dependency-depth audit                | Depends on stable YAML identifiers, generated exports, repo inventory, root packaging discipline, and explicit user authorization for live writes. Does not block the active Lean/content pre-code readiness chain. |
| Phase split decision                  | Existing 20.15-20.20 remain broad contracts; V1.24 adds concrete live-project activation phases after checking those existing phases to avoid scope duplication.                                                    |

|                                        |                                                                                                                                                                                              |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positive path plan                     | Proceed from read-only baseline -> migration package -> import package -> explicit live execution -> read-only/RLS/frontend verification.                                                    |
| Module implementation manifest         | No Lean modules. Future DB artifacts may be SQL migrations/import scripts/frontend contract files under Repository/database/supabase.                                                        |
| Semantic placement decision            | Natural placement is DB-REVIEW/Supabase infrastructure sidechain, not a Lean derivation phase.                                                                                               |
| Reuse and duplication audit            | Existing 20.15-20.20 were checked and kept;<br>new phases are concrete activation subchain, not duplicates.                                                                                  |
| Canonical generator policy             | Supabase rows must be generated from Master YAML/generated_exports/repo_inventory via canonical importer, not manual table edits.                                                            |
| Module compactness rule                | Keep DB artifacts isolated under Repository/database/supabase and avoid leaking DB concerns into Lean module names.                                                                          |
| Refactor regression protocol           | No Lean refactor. Regression checks are generated tables/PDF, DB schema/import dry-run, live inventory/advisor output after authorized execution.                                            |
| Refactor migration metrics             | No Lean module migration. Future DB migration metrics: schemas/tables/views/policies/row counts/import hashes.                                                                               |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                           |
| ExecComplex boundary policy            | No ExecComplex boundary affected.                                                                                                                                                            |
| Consumer-contract direction            | Consumers are public web/query/review tooling only. No pillar handoff or mathematical consumer rights are granted.                                                                           |
| Governance-overhead review             | Moderate but justified: direct DB access now exists, so broad DB phases need concrete activation contracts before any write.                                                                 |
| Proof rehearsal before implementation  | Dry-run schema/import artifacts, then when authorized apply migration/import, check tables/views, advisor output, anon read-only access and no public writes.                                |
| Expected tactics                       | None;<br>database/tooling phase, not Lean proof phase.                                                                                                                                       |
| Expected mathlib imports               | None added.                                                                                                                                                                                  |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                |
| Concrete computable instance traversal | Concrete traversal is Supabase project discovery, planned schema/import tables, and later live table/view verification.                                                                      |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete output is DB tooling metadata and later Supabase rows with snapshot provenance.                                                         |
| Expected executable witness            | For planning phases: generate_tables.py/PDF generation. For future live phases: migration/import report, row counts, advisor output and read-only test results.                              |
| Mathlib complication log               | No Lean/mathlib source complication introduced;<br>root manifest/toolchain unchanged.                                                                                                        |
| Noncomputable boundary audit           | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                              |
| Mathlib mitigation/refactor layer      | Not applicable;<br>database/tooling layer only.                                                                                                                                              |
| Bridge gap status                      | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                                        |
| Natural backjump/refactor layer        | If DB requirements conflict with YAML/export structure, patch the YAML/export schema or DB importer layer;<br>do not alter Lean derivations for DB convenience.                              |
| Implementation prompt contract         | Future live DB work must be explicit: apply migration/import only after user authorization, write only to Supabase, never edit Lean files, and produce report/checksums/advisor output.      |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and Supabase public-read-only rules.                                                                       |
| How implemented                        | Planned. Will produce initial SQL migration package only;<br>no live apply_migration until explicit authorization.                                                                           |
| Verification / evidence                | Planned evidence: SQL migration file, schema/table/view inventory expectation, no secret material.                                                                                           |
| Proof strategy                         | Separate broad DB architecture contracts 20.15-20.20 from concrete live activation phases 20.22-20.26;<br>require snapshot_id, hashes, import reports and explicit authorization for writes. |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                            |
| Post-implementation plan check         | Supabase DB sidechain remains W/G tooling and does not alter active mathematical/content cursor 1.1.1.1.5.1.                                                                                 |
| Artifact packaging rule                | Package migration/import/frontend-contract artifacts in Repository/database/supabase or reports;<br>do not package secrets, service_role keys or generated DB credentials.                   |
| Implementation notes                   | Supabase/Postgres DB/tooling sidechain only. It writes no Lean files and cannot act as CNNA truth system or phase-release authority.                                                         |

|                                      |                                                                                                                                                                                                                                                                                                                  |

Phase 20.24 – Supabase snapshot import package from YAML/generated exports

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                    | Record              |
|--------------------------|---------------------|
| Phase status             | W                   |
| Context class            | DatabaseMirrorPhase |
| Phase documentation tier | F1                  |

|                                        |                                                                                                                                                                                                                     |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase documentation depth requirement  | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                      |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                  |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                 |
| Implementation status                  | planned-not-active                                                                                                                                                                                                  |
| Preparation status                     | planned-sidechain                                                                                                                                                                                                   |
| Phase type                             | infrastructure                                                                                                                                                                                                      |
| Phase-type-specific contract           | Infrastructure/tooling sidechain: Supabase stores generated-secondary planning metadata for public read-only query/visualization; no Lean semantic authority.                                                       |
| Title / state                          | Supabase snapshot import package from YAML/generated exports                                                                                                                                                        |
| Preparation workflow                   | Supabase live import activation workflow.                                                                                                                                                                           |
| Source-to-CNNA mapping                 | Maps CNNA generated-secondary metadata to Supabase as public query/visualization data. It is not a mathematical CNNA input and not a Lean replacement.                                                              |
| Dependency-depth audit                 | Depends on stable YAML identifiers, generated exports, repo inventory, root packaging discipline, and explicit user authorization for live writes. Does not block the active Lean/content pre-code readiness chain. |
| Phase split decision                   | Existing 20.15-20.20 remain broad contracts;<br>V1.24 adds concrete live-project activation phases after checking those existing phases to avoid scope duplication.                                                 |
| Positive path plan                     | Proceed from read-only baseline -> migration package -> import package -> explicit live execution -> read-only/RLS/frontend verification.                                                                           |
| Module implementation manifest         | No Lean modules. Future DB artifacts may be SQL migrations/import scripts/frontend contract files under Repository/database/supabase.                                                                               |
| Semantic placement decision            | Natural placement is DB-REVIEW/Supabase infrastructure sidechain, not a Lean derivation phase.                                                                                                                      |
| Reuse and duplication audit            | Existing 20.15-20.20 were checked and kept;<br>new phases are concrete activation subchain, not duplicates.                                                                                                         |
| Canonical generator policy             | Supabase rows must be generated from Master YAML/generated_exports/repo_inventory via canonical importer, not manual table edits.                                                                                   |
| Module compactness rule                | Keep DB artifacts isolated under Repository/database/supabase and avoid leaking DB concerns into Lean module names.                                                                                                 |
| Refactor regression protocol           | No Lean refactor. Regression checks are generated tables/PDF, DB schema/import dry-run, live inventory/advisor output after authorized execution.                                                                   |
| Refactor migration metrics             | No Lean module migration. Future DB migration metrics: schemas/tables/views/policies/row counts/import hashes.                                                                                                      |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                  |
| ExecComplex boundary policy            | No ExecComplex boundary affected.                                                                                                                                                                                   |
| Consumer-contract direction            | Consumers are public web/query/review tooling only. No pillar handoff or mathematical consumer rights are granted.                                                                                                  |
| Governance-overhead review             | Moderate but justified: direct DB access now exists, so broad DB phases need concrete activation contracts before any write.                                                                                        |
| Proof rehearsal before implementation  | Dry-run schema/import artifacts, then when authorized apply migration/import, check tables/views, advisor output, anon read-only access and no public writes.                                                       |
| Expected tactics                       | None;<br>database/tooling phase, not Lean proof phase.                                                                                                                                                              |
| Expected mathlib imports               | None added.                                                                                                                                                                                                         |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                       |
| Concrete computable instance traversal | Concrete traversal is Supabase project discovery, planned schema/import tables, and later live table/view verification.                                                                                             |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete output is DB tooling metadata and later Supabase rows with snapshot provenance.                                                                                |
| Expected executable witness            | For planning phases: generate_tables.py/PDF generation. For future live phases: migration/import report, row counts, advisor output and read-only test results.                                                     |
| Mathlib complication log               | No Lean/mathlib source complication introduced;<br>root manifest/toolchain unchanged.                                                                                                                               |
| Noncomputable boundary audit           | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                                                     |
| Mathlib mitigation/refactor layer      | Not applicable;<br>database/tooling layer only.                                                                                                                                                                     |
| Bridge gap status                      | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                                                               |
| Natural backjump/refactor layer        | If DB requirements conflict with YAML/export structure, patch the YAML/export schema or DB importer layer;<br>do not alter Lean derivations for DB convenience.                                                     |
| Implementation prompt contract         | Future live DB work must be explicit: apply migration/import only after user authorization, write only to Supabase, never edit Lean files, and produce report/checksums/advisor output.                             |

|                                      |                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Global no-go inheritance             | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and Supabase public-read-only rules.                                                                                                                                                                                           |
| How implemented                      | Planned. Will produce importer/seed contract reading YAML/generated_exports/repo_inventory and writing snapshot-tagged internal rows only after authorization.                                                                                                                                                   |
| Verification / evidence              | Planned evidence: importer script, dry-run report, generated SQL or row-count manifest, source hashes.                                                                                                                                                                                                           |
| Proof strategy                       | Separate broad DB architecture contracts 20.15-20.20 from concrete live activation phases 20.22-20.26;<br>require snapshot_id, hashes, import reports and explicit authorization for writes.                                                                                                                     |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                |
| Post-implementation plan check       | Supabase DB sidechain remains W/G tooling and does not alter active mathematical/content cursor 1.1.1.1.5.1.                                                                                                                                                                                                     |
| Artifact packaging rule              | Package migration/import/frontend-contract artifacts in Repository/database/supabase or reports;<br>do not package secrets, service_role keys or generated DB credentials.                                                                                                                                       |
| Implementation notes                 | Supabase/Postgres DB/tooling sidechain only. It writes no Lean files and cannot act as CNNA truth system or phase-release authority.                                                                                                                                                                             |

### Phase 20.25 – Explicitly authorized live Supabase schema migration and first snapshot import

**Table legend.**   = green/closed and derived-only;   = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   = orange/implementable after stated predecessor closure;   = yellow/active and implementable now;   = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                              |

| Phase status                           | W                                                                                                                                                                                                                   |
| Context class                          | DatabaseMirrorPhase                                                                                                                                                                                                 |
| Phase documentation tier               | F1                                                                                                                                                                                                                  |
| Phase documentation depth requirement  | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                      |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                  |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                 |
| Implementation status                  | planned-not-active                                                                                                                                                                                                  |
| Preparation status                     | planned-sidechain                                                                                                                                                                                                   |
| Phase type                             | infrastructure                                                                                                                                                                                                      |
| Phase-type-specific contract           | Infrastructure/tooling sidechain: Supabase stores generated-secondary planning metadata for public read-only query/visualization; no Lean semantic authority.                                                       |
| Title / state                          | Explicitly authorized live Supabase schema migration and first snapshot import                                                                                                                                      |
| Preparation workflow                   | Supabase live import activation workflow.                                                                                                                                                                           |
| Source-to-CNNA mapping                 | Maps CNNA generated-secondary metadata to Supabase as public query/visualization data. It is not a mathematical CNNA input and not a Lean replacement.                                                              |
| Dependency-depth audit                 | Depends on stable YAML identifiers, generated exports, repo inventory, root packaging discipline, and explicit user authorization for live writes. Does not block the active Lean/content pre-code readiness chain. |
| Phase split decision                   | Existing 20.15-20.20 remain broad contracts; V1.24 adds concrete live-project activation phases after checking those existing phases to avoid scope duplication.                                                    |
| Positive path plan                     | Proceed from read-only baseline -> migration package -> import package -> explicit live execution -> read-only/RLS/frontend verification.                                                                           |
| Module implementation manifest         | No Lean modules. Future DB artifacts may be SQL migrations/import scripts/frontend contract files under Repository/database/supabase.                                                                               |
| Semantic placement decision            | Natural placement is DB-REVIEW/Supabase infrastructure sidechain, not a Lean derivation phase.                                                                                                                      |
| Reuse and duplication audit            | Existing 20.15-20.20 were checked and kept; new phases are concrete activation subchain, not duplicates.                                                                                                            |
| Canonical generator policy             | Supabase rows must be generated from Master YAML/generated_exports/repo_inventory via canonical importer, not manual table edits.                                                                                   |
| Module compactness rule                | Keep DB artifacts isolated under Repository/database/supabase and avoid leaking DB concerns into Lean module names.                                                                                                 |
| Refactor regression protocol           | No Lean refactor. Regression checks are generated tables/PDF, DB schema/import dry-run, live inventory/advisor output after authorized execution.                                                                   |
| Refactor migration metrics             | No Lean module migration. Future DB migration metrics: schemas/tables/views/policies/row counts/import hashes.                                                                                                      |
| Lean/mathlib version policy            | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                  |
| ExecComplex boundary policy            | No ExecComplex boundary affected.                                                                                                                                                                                   |
| Consumer-contract direction            | Consumers are public web/query/review tooling only. No pillar handoff or mathematical consumer rights are granted.                                                                                                  |
| Governance-overhead review             | Moderate but justified: direct DB access now exists, so broad DB phases need concrete activation contracts before any write.                                                                                        |
| Proof rehearsal before implementation  | Dry-run schema/import artifacts, then when authorized apply migration/import, check tables/views, advisor output, anon read-only access and no public writes.                                                       |
| Expected tactics                       | None; database/tooling phase, not Lean proof phase.                                                                                                                                                                 |
| Expected mathlib imports               | None added.                                                                                                                                                                                                         |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                       |
| Concrete computable instance traversal | Concrete traversal is Supabase project discovery, planned schema/import tables, and later live table/view verification.                                                                                             |
| Computable path non-skeleton status    | Not an operational/computable CNNA path; concrete output is DB tooling metadata and later Supabase rows with snapshot provenance.                                                                                   |

|                                      |                                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expected executable witness          | For planning phases: generate_tables.py/PDF generation. For future live phases: migration/import report, row counts, advisor output and read-only test results.                                                                                                                                                         |
| Mathlib complication log             | No Lean/mathlib source complication introduced;<br>root manifest/toolchain unchanged.                                                                                                                                                                                                                                   |
| Noncomputable boundary audit         | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                                                                                                                                                         |
| Mathlib mitigation/refactor layer    | Not applicable;<br>database/tooling layer only.                                                                                                                                                                                                                                                                         |
| Bridge gap status                    | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                                                                                                                                                                   |
| Natural backjump/refactor layer      | If DB requirements conflict with YAML/export structure, patch the YAML/export schema or DB importer layer;<br>do not alter Lean derivations for DB convenience.                                                                                                                                                         |
| Implementation prompt contract       | Future live DB work must be explicit: apply migration/import only after user authorization, write only to Supabase, never edit Lean files, and produce report/checksums/advisor output.                                                                                                                                 |
| Global no-go inheritance             | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and Supabase public-read-only rules.                                                                                                                                                                                                  |
| How implemented                      | Planned future DB-write phase. Requires explicit user authorization in the conversation before apply_migration/execute_sql writes.                                                                                                                                                                                      |
| Verification / evidence              | Future evidence: migration result, import report, row counts, snapshot_id, checksums, no Lean file diff.                                                                                                                                                                                                                |
| Proof strategy                       | Separate broad DB architecture contracts 20.15-20.20 from concrete live activation phases 20.22-20.26;<br>require snapshot_id, hashes, import reports and explicit authorization for writes.                                                                                                                            |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                                                                                       |
| Post-implementation plan check       | Supabase DB sidechain remains W/G tooling and does not alter active mathematical/content cursor 1.1.1.1.5.1.                                                                                                                                                                                                            |
| Artifact packaging rule              | Package migration/import/frontend-contract artifacts in Repository/database/supabase or reports;<br>do not package secrets, service_role keys or generated DB credentials.                                                                                                                                              |
| Implementation notes                 | Supabase/Postgres DB/tooling sidechain only. It writes no Lean files and cannot act as CNNA truth system or phase-release authority.                                                                                                                                                                                    |

## Phase 20.26 – Post-import read-only/RLS/advisor verification and web-frontend handoff

**Table legend.**   = green/closed and derived-only;   = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   = orange/implementable after stated predecessor closure;   = yellow/active and implementable now;   = red/locked

Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                              |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                                                   |
| Context class                         | DatabaseMirrorPhase                                                                                                                                                                                                 |
| Phase documentation tier              | F1                                                                                                                                                                                                                  |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                      |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                  |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                 |
| Implementation status                 | planned-not-active                                                                                                                                                                                                  |
| Preparation status                    | planned-sidechain                                                                                                                                                                                                   |
| Phase type                            | infrastructure                                                                                                                                                                                                      |
| Phase-type-specific contract          | Infrastructure/tooling sidechain: Supabase stores generated-secondary planning metadata for public read-only query/visualization; no Lean semantic authority.                                                       |
| Title / state                         | Post-import read-only/RLS/advisor verification and web-frontend handoff                                                                                                                                             |
| Preparation workflow                  | Supabase live import activation workflow.                                                                                                                                                                           |
| Source-to-CNNA mapping                | Maps CNNA generated-secondary metadata to Supabase as public query/visualization data. It is not a mathematical CNNA input and not a Lean replacement.                                                              |
| Dependency-depth audit                | Depends on stable YAML identifiers, generated exports, repo inventory, root packaging discipline, and explicit user authorization for live writes. Does not block the active Lean/content pre-code readiness chain. |
| Phase split decision                  | Existing 20.15-20.20 remain broad contracts; V1.24 adds concrete live-project activation phases after checking those existing phases to avoid scope duplication.                                                    |
| Positive path plan                    | Proceed from read-only baseline -> migration package -> import package -> explicit live execution -> read-only/RLS/frontend verification.                                                                           |
| Module implementation manifest        | No Lean modules. Future DB artifacts may be SQL migrations/import scripts/frontend contract files under Repository/database/supabase.                                                                               |
| Semantic placement decision           | Natural placement is DB-REVIEW/Supabase infrastructure sidechain, not a Lean derivation phase.                                                                                                                      |
| Reuse and duplication audit           | Existing 20.15-20.20 were checked and kept; new phases are concrete activation subchain, not duplicates.                                                                                                            |
| Canonical generator policy            | Supabase rows must be generated from Master YAML/generated_exports/repo_inventory via canonical importer, not manual table edits.                                                                                   |
| Module compactness rule               | Keep DB artifacts isolated under Repository/database/supabase and avoid leaking DB concerns into Lean module names.                                                                                                 |
| Refactor regression protocol          | No Lean refactor. Regression checks are generated tables/PDF, DB schema/import dry-run, live inventory/advisor output after authorized execution.                                                                   |
| Refactor migration metrics            | No Lean module migration. Future DB migration metrics: schemas/tables/views/policies/row counts/import hashes.                                                                                                      |
| Lean/mathlib version policy           | No Lean/mathlib version change. Lean data timestamp remains fixed.                                                                                                                                                  |
| ExecComplex boundary policy           | No ExecComplex boundary affected.                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                                                               |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consumer-contract direction            | Consumers are public web/query/review tooling only. No pillar handoff or mathematical consumer rights are granted.                                                                                                                                            |
| Governance-overhead review             | Moderate but justified: direct DB access now exists, so broad DB phases need concrete activation contracts before any write.                                                                                                                                  |
| Proof rehearsal before implementation  | Dry-run schema/import artifacts, then when authorized apply migration/import, check tables/views, advisor output, anon read-only access and no public writes.                                                                                                 |
| Expected tactics                       | None;<br>database/tooling phase, not Lean proof phase.                                                                                                                                                                                                        |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                                                   |
| ExecComplex/computable plan            | No ExecComplex object introduced or consumed.                                                                                                                                                                                                                 |
| Concrete computable instance traversal | Concrete traversal is Supabase project discovery, planned schema/import tables, and later live table/view verification.                                                                                                                                       |
| Computable path non-skeleton status    | Not an operational/computable CNNA path;<br>concrete output is DB tooling metadata and later Supabase rows with snapshot provenance.                                                                                                                          |
| Expected executable witness            | For planning phases: generate_tables.py/PDF generation. For future live phases: migration/import report, row counts, advisor output and read-only test results.                                                                                               |
| Mathlib complication log               | No Lean/mathlib source complication introduced;<br>root manifest/toolchain unchanged.                                                                                                                                                                         |
| Noncomputable boundary audit           | No Lean source edited;<br>no noncomputable boundary introduced.                                                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | Not applicable;<br>database/tooling layer only.                                                                                                                                                                                                               |
| Bridge gap status                      | No mathematical bridge closed. The bridge is publication/query tooling between YAML exports and a public read-only database/frontend.                                                                                                                         |
| Natural backjump/refactor layer        | If DB requirements conflict with YAML/export structure, patch the YAML/export schema or DB importer layer;<br>do not alter Lean derivations for DB convenience.                                                                                               |
| Implementation prompt contract         | Future live DB work must be explicit: apply migration/import only after user authorization, write only to Supabase, never edit Lean files, and produce report/checksums/advisor output.                                                                       |
| Global no-go inheritance               | All global no-go guardrails apply;<br>especially Lean-primary/generated-secondary and Supabase public-read-only rules.                                                                                                                                        |
| How implemented                        | Planned future verification phase after live DB import. Will verify anon read-only views, no public writes, advisors and frontend data contract.                                                                                                              |
| Verification / evidence                | Future evidence: list_tables, get_advisors, public view checks, failed write attempts if safe, frontend contract artifact.                                                                                                                                    |
| Proof strategy                         | Separate broad DB architecture contracts 20.15-20.20 from concrete live activation phases 20.22-20.26;<br>require snapshot_id, hashes, import reports and explicit authorization for writes.                                                                  |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table/PDF generation only after YAML update.                                                                                                                                                             |
| Post-implementation plan check         | Supabase DB sidechain remains W/G tooling and does not alter active mathematical/content cursor 1.1.1.1.5.1.                                                                                                                                                  |
| Artifact packaging rule                | Package migration/import/frontend-contract artifacts in Repository/database/supabase or reports;<br>do not package secrets, service_role keys or generated DB credentials.                                                                                    |
| Implementation notes                   | Supabase/Postgres DB/tooling sidechain only. It writes no Lean files and cannot act as CNNA truth system or phase-release authority.                                                                                                                          |

### Phase 20.27 – OOP-style phase/object context-class taxonomy and table-wide Lean/tool/reference separation

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                       |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                            |
| Context class                         | ToolInfrastructurePhase                                                                                                                                      |
| Phase documentation tier              | F3                                                                                                                                                           |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                    |
| Record change version                 | unchanged-by-V1.01                                                                                                                                           |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                          |
| Implementation status                 | completed                                                                                                                                                    |
| Preparation status                    | closed-tooling-governance                                                                                                                                    |
| Phase type                            | infrastructure                                                                                                                                               |
| Phase-type-specific contract          | ToolInfrastructurePhase: schema/tooling phase; no direct Lean derivation release.                                                                            |
| Title / state                         | OOP-style phase/object context-class taxonomy and table-wide Lean/tool/reference separation                                                                  |
| Preparation workflow                  | Schema/classification patch in the Single YAML Master followed by generated-table regeneration.                                                              |
| Source-to-CNNA mapping                | The OOP analogy is used only at planning-schema level: classes give type boundaries and allowed consumers; they do not create mathematical CNNA entities.    |
| Dependency-depth audit                | Depends on existing status legend, phase-object-link policy, object register, proof dossiers and generated table pipeline; no Lean dependency is introduced. |

|                                        |                                                                                                                                                                                                          |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase split decision                   | Kept as one tooling phase 20.27 because it changes schema/table semantics only;<br>no mathematical derivation phase is spawned.                                                                          |
| Positive path plan                     | Classify all existing rows first, then make context visible in generated phase/object/proof/scratchpad surfaces;<br>later DB schema can mirror these fields.                                             |
| Module implementation manifest         | Records table-renderer and YAML schema changes only;<br>no new Lean modules.                                                                                                                             |
| Semantic placement decision            | Placed under 20.* because this is a planning/documentation tool schema change, not a Pillar-A mathematical object.                                                                                       |
| Reuse and duplication audit            | Reuses existing status legend, phase-object-link and object register instead of creating a parallel object register.                                                                                     |
| Canonical generator policy             | Context classes are type tags for review surfaces;<br>Lean code remains the only primary truth system.                                                                                                   |
| Module compactness rule                | No new script besides small patch helper;<br>permanent changes are in the existing generator scripts.                                                                                                    |
| Refactor regression protocol           | Generated tables before/after are regenerated from the same YAML source;<br>old status columns remain intact.                                                                                            |
| Refactor migration metrics             | Adds one phase, one object, one proof dossier and context-class fields to all existing phase/object rows.                                                                                                |
| Lean/mathlib version policy            | No mathlib dependency change.                                                                                                                                                                            |
| ExecComplex boundary policy            | No ExecComplex change.                                                                                                                                                                                   |
| Consumer-contract direction            | Consumers must read Context class before using status/link fields.                                                                                                                                       |
| Governance-overhead review             | Adds a single orthogonal class field rather than duplicating registers;<br>overhead is justified by preventing category errors.                                                                          |
| Proof rehearsal before implementation  | Completeness condition: count(phases with Context class)=count(phases) and count(objects with Context class)=count(objects);<br>class names must be from taxonomy.                                       |
| Expected tactics                       | not applicable;<br>no Lean proof                                                                                                                                                                         |
| Expected mathlib imports               | none                                                                                                                                                                                                     |

| Noncomputable boundary audit           | No Lean noncomputable boundary touched.                                                                                                                                                                  |
| Mathlib mitigation/refactor layer      | none                                                                                                                                                                                                     |
| Bridge gap status                      | No bridge opened;<br>this is a meta-schema boundary that prevents false bridges from tool/reference classes into Lean classes.                                                                           |
| Natural backjump/refactor layer        | Generated planning schema and table renderer, not Lean consumers.                                                                                                                                        |
| Implementation prompt contract         | Future implementation prompts must preserve Context class and may not infer Lean derivability from Object status or Phase status alone.                                                                  |
| Global no-go inheritance               | Inherits all global no-go guardrails;<br>especially no tool/reference source becomes CNNA input.                                                                                                         |
| How implemented                        | Added explicit context-class taxonomy fields to every phase and object row;<br>extended generated phase/object/proof/scratchpad/module-manifest tables so status and context are orthogonal and visible. |
| Verification / evidence                | generate_tables.py validation and full A3 PDF generation after the V1.26 patch;<br>no Lean source files changed.                                                                                         |
| Proof strategy                         | Generated-schema proof by complete coverage: every registered phase and object must carry Context class;<br>validators reject missing classes;<br>generated tables render the field next to status.      |
| Build result                           | No Lean build;<br>documentation/tool generation only.                                                                                                                                                    |
| Post-implementation plan check         | All tables carrying phase/object logic now expose context classes. DB/publication phases remain secondary;<br>Lean derivation phases remain red/yellow/orange/green by release evidence.                 |

|                                      |                                                                                                                                                                                                                                                                                                         |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Artifact packaging rule              | Return full zip and generated PDF;<br>no Lean-build claim.                                                                                                                                                                                                                                              |
| Implementation notes                 | This is a planning/tooling classification phase. It applies object-oriented class semantics to the planning layer: each phase/object has a class, inherited boundary, truth role and consumer constraint. It is not a mathematical CNNA generator.                                                      |

20    Technical appendix: module-change manifest and semantic placement gate

**What this section shows.**    This appendix is not a second phase table. It is a narrow module-change ledger used only when a phase proposes new Lean modules, module moves, module merges, public API changes or import-surface changes. Ordinary planning, documentation and tool phases should be governed by the main phase table plus scratchpad instead. The appendix is kept for auditability of real code-surface changes, not for normal roadmap reading.

**Module-change manifest rule.**    This appendix is not a second phase table and does not release phases. It is a narrow technical ledger used only when a phase proposes new Lean modules, module moves, module merges, public API changes, import-surface changes, generator seams, or compatibility facades. Its rows are generated from implementation-scratchpad module/refactor fields; phases without module/API changes do not need meaningful rows here. The main phase table remains the primary status and release surface.

**Table legend.**    G = green/closed and derived-only;    W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;    O = orange/implementable after stated predecessor closure;    Y = yellow/active and implementable now;    R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase     | Status                                            | Phase type     | Context class                 | Added modules | Modified modules | Reusable existing modules | Manifest / placement / compactness                                                                                                                                                                                                                                                                  | Reuse / generator / duplicate risks                                                                                                                                                            | Implementation risk fields                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |

| 1.1.1.1.1 | G      | infrastructure | Lean;<br>Governance;<br>Phase | —             | <ul style="list-style-type: none"> <li>masters/cnna_roadmap_master.yaml</li> <li>scripts/generate_tables.py</li> <li>README.md</li> </ul> | <ul style="list-style-type: none"> <li>CNNA/PillarA/Arithmetic/Notation.lean as source to split, not as target monolith</li> <li>existing Smoke/Test generator modules as candidates for generator-like work</li> </ul>                                                                                                                                                | <p>Closed contract: every scratchpad record must expose proposed_added_modules, proposed_modified_modules, reusable_existing_modules, semantic placement, rejection/fit decision, public/legacy/API role, import direction, expected downstream consumers, phase_type obligations, refactor regression protocol, version impact, concrete-instance traversal, generic test placement, mathlib complication log, and noncomputable boundary audit before Lean edits.; The manifest is planning infrastructure and belongs to the single YAML master plus generated views. It is not a Lean module and must not be implemented as phase-local code. Future code modules are created only when an existing semantic module cannot be safely extended or wrapped.; Closed rule: phase granularity is not file granularity. A later phase must justify every new module by semantic ownership, API/firewall direction, or unavoidable import split.</p> | <p>Phase 1.1.1.1.1 names reusable candidates but defers semantic generator classification to 1.1.1.1.2. Duplicate implementation remains blocked already at manifest level.; Any generator-like phase must consume this manifest, then pass through 1.1.1.1.2 before Lean code. The manifest table must state whether O07/canonical smoke-test generator is reused, extended, or rejected.; new generator/request/output helper names without canonical generator route; IdealThread.carrier/family singleton facts; CutSpec.full carrier facts; RecursiveSchurSource/MobiusTransfer recurrence logic; string-like analogy used as generator</p>                                                    | <p>Every proposed public wrapper must state its expected consumers and import direction. BoundaryOperatorProfile must prepare for Phase 4.1 without importing Phase 4. For BR08/CD8 specifically, earlier route modules export data downstream and must not import the bridge.; This gate does not refactor code, but it must require every later refactor manifest to declare wrapper-first/incremental vs atomic mode. Default for 1.1.2 is wrapper-first incremental with local full-build evidence per package.; Every module manifest must state whether it stays on Lean 4.28.0/mathlib baseline, uses no mathlib change, or requires a separate upgrade gate.; This active gate is infrastructure-only: it will not introduce operational Lean code. For every later operational phase, the manifest must include a concrete finite instance path from generated input to intended endpoint. This phase must plan generic finite test traversal, not only special sentinels, for every upcoming computable path.; No new mathlib import in this gate. Later manifests must list expected mathlib imports and whether each is executable, noncomputable-only, classical-only, or mirror-layer-only. Scalar architecture check added: any proposed new module must classify Complex/Real/QuadraticAlgebra dependencies under LEG31. Derived-quadratic update: any proposed QuadraticAlgebra/AdjoinRoot/ExactQuadratic module must state whether it is a schema, D-instantiation, proof/mirror reference, or executable coordinate layer.; No Lean operational code changed. Later phases must document noncomputable leakage risk before implementation.</p> |
| 1.1.1.1.2 | G      | infrastructure | Lean;<br>Governance;<br>Phase | —             | <ul style="list-style-type: none"> <li>masters/cnna_roadmap_master.yaml</li> <li>scripts/generate_tables.py</li> <li>README.md</li> </ul> | <ul style="list-style-type: none"> <li>CNNA.PillarA.Arithmetic.Smoke.GeneratedSource</li> <li>CNNA.PillarA.Arithmetic.Smoke.GeneratedMainPath</li> <li>CNNA.PillarA.Arithmetic.ActionsGeneratorAsAPhaseLocal</li> <li>CNNA.PillarA.Arithmetic.Actions.ActionFormatDecision</li> <li>scripts/generate_tables.py</li> <li>scripts/build_export_script_v1.8.py</li> </ul> | <p>Closed contract consumed from LEG10. v41 adds no Lean module; It extends the planning generator and YAML master to render the reuse/duplication ledger.; The policy belongs in the single YAML master and generated planning views. It must not be implemented as a phase-local Lean status module; later neutral generator code is allowed only after a concrete module-manifest proof.; Closed rule: a generator policy row is not a new Lean file. Later code should prefer one coherent reusable generator/API seam plus wrappers over phase-local generator files.</p>                                                                                                                                                                                                                                                                                                                                                                     | <p>Closed: generator-like operations are classified by ledger rows as consume existing, extend existing, wrap existing, artifact-only split, or genuine semantic split. Duplicate generator implementations are blocked by default.; Closed rule: the Smoke/GeneratedSource-MainPath seam is canonical for generated ToC/smoke semantics; action-like semantics reuse GeneratorActionInventory/ActionFormatDecision; documentation/inventory scripts are artifact generators and comparison/audit only.; experiment request/output generator; phase-local extraction generator; parallel ledger generator; second smoke-test generator; independent documentation/proofbook source outside YAML</p> | <p>Exports a planning/API policy to 1.1.1.1.3, 1.1.1.3, Phase 5, O07, heuristic lattice tests, and all generator-like phases. It does not export mathematical data to downstream pillars.; Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.; Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.; Infrastructure-only; no operational finite instance is introduced. Future operational generator phases must provide concrete finite traversal through the canonical seam.; No Lean/mathlib import is introduced by this phase.; No noncomputable boundary introduced; no Lean operational path changed.</p>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |

| 20.6  | G      | documentation  | Generated;<br>Artifact;<br>Phase  | <ul style="list-style-type: none"> <li>Repository/scripts/generate_context_doc.py</li> </ul>                                                                 | <ul style="list-style-type: none"> <li>Repository/masters/cnna_roadmap_master.yaml</li> <li>README.md</li> </ul>                                                | <ul style="list-style-type: none"> <li>Repository/scripts/generate_tables.py</li> <li>Repository/generated_exports/*.tsv</li> <li>Repository/masters/cnna_roadmap_master.yaml</li> </ul>                                 | Added Repository/scripts/generate_context_doc.py. No Lean module manifest change.; Belongs to DB-REVIEW generated-secondary documentation tooling. It is not a Pillar-A mathematical derivation layer and not a database truth layer.; Keeps targeted documentation compact by filtering rows per context while retaining section topology. Reduces overhead during Lean implementation closeouts.                    | Reuses the Single-YAML-Master and generated_exports. Does not create a second master; output manifest records the source and filter terms.; Context documents are reproducible generated views. Curated profiles live in YAML so they can later round-trip into the database representation.; second-source-of-truth risk; profile-overfiltering risk; false-negative relevance risk; generated-view-as-truth risk                                                       | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.; No Lean refactor. Future tooling must preserve generated-view reproducibility and YAML single-source rule.; No Lean/mathlib version change. Lean data timestamp remains fixed.; Not an operational Lean computation. Concrete traversal is metadata path: YAML row -> generated TSV/TeX/PDF -> future DB row/view.; None; no mathlib imports or Lean code changes.; No noncomputable Lean boundary involved; semantic review is a documentation governance rule.                                                                         |
| 20.7  | G      | documentation  | Generated;<br>Artifact;<br>Phase  | —                                                                                                                                                            | <ul style="list-style-type: none"> <li>Repository/scripts/generate_tables.py</li> <li>Repository/masters/cnna_roadmap_master.yaml</li> <li>README.md</li> </ul> | <ul style="list-style-type: none"> <li>Repository/scripts/generate_tables.py</li> <li>Repository/repo_inventory/raw_export/*.json</li> <li>Repository/tables/module_inventory.tex</li> </ul>                             | Modified Repository/scripts/generate_tables.py only; no Lean module manifest change.; Belongs to DB-REVIEW generated-secondary documentation tooling. It is not a Pillar-A mathematical derivation layer, not a database truth layer, and not a formal CNNA theorem.; Keeps the front section compact: short facts table plus the existing inventory/graph view. Avoids duplicating the old module-inventory section. | Reuses the existing module inventory table instead of adding a duplicate standalone module-inventory section. Adds only a generated project_stats view and YAML records for metaphor/license.; Stats rows are reproducible generated views. Guiding metaphors and license notices live in YAML so they can later round-trip into database views.; second-source-of-truth risk; metaphor-as-theorem risk; project-stats-as-truth-certificate risk; license-overreach risk | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.; No Lean refactor. Future tooling must preserve generated-view reproducibility, YAML single-source rule, and old-module-inventory-under-Stats placement.; No Lean/mathlib version change. Lean data timestamp remains fixed.; Not an operational Lean computation. Concrete traversal is metadata path: YAML/repo inventory/source counts -> generated TSV/TeX/PDF -> future database view.; None; no mathlib imports or Lean code changes.; No noncomputable Lean boundary involved; semantic review is a documentation governance rule. |
| 20.8  | G      | documentation  | Generated;<br>Artifact;<br>Phase  | <ul style="list-style-type: none"> <li>Repository/scripts/generate_full_document.py</li> <li>Repository/scripts/clean_generated_root_artifacts.py</li> </ul> | <ul style="list-style-type: none"> <li>Repository/masters/cnna_roadmap_master.yaml</li> <li>README.md</li> </ul>                                                | <ul style="list-style-type: none"> <li>Repository/scripts/generate_tables.py</li> <li>Repository/scripts/generate_context_doc.py</li> <li>Repository/tables/*.tex</li> <li>Repository/generated_exports/*.tsv</li> </ul> | Added two Python tool scripts only; no Lean module manifest change.; Belongs to DB-REVIEW generated-secondary documentation/tooling. It is a retention policy, not a Pillar-A mathematical derivation layer.; Reduces package clutter and clarifies active source boundaries without changing Lean source structure.                                                                                                  | Reuses existing generation pipeline; avoids duplicating versioned full-doc TeX/PDF in root. Adds a single canonical full-document generator path.; Full document TeX/PDF must be generated from YAML/tables by script and treated as disposable unless explicitly requested as an external artifact.; root PDF/TEX clutter; historical report as false source; generated-secondary artifact treated as authoritative; package bloat                                      | All consumers are documentation/review/tooling consumers. No pillar handoff or mathematical consumer rights are granted.; No Lean refactor. Verify source/control files remain, reports are archived, and root generated artifacts are absent after cleanup.; No Lean/mathlib version change. Lean data timestamp remains fixed.; Not an operational Lean computation. Concrete traversal is filesystem classification: root artifacts -> archive or delete -> regenerate on demand.; None; no mathlib imports or Lean code changes.; No noncomputable Lean boundary involved; only generated documentation artifacts are classified.                              |
