| Phase                           | 1.1.1.1.0.12                                                                                                                                                                                                                                                                                                                                       |
| Source objects                  | O00, LEG20, LEG22, current code audit, mathlib Complex and QuadraticAlgebra docs                                                                                                                                                                                                                                                                   |
| Definitions                     | Top-level scalar policy separating rational ExecComplex, required exact quadratic schema/provenance, analytic Complex mirror, and late CD noncircularity audit.                                                                                                                                                                                    |
| Proof target                    | Prevent false assumption that ExecComplex is a complete C layer or that CD can replace it before proof.                                                                                                                                                                                                                                            |
| Proof sketch                    | Code audit shows ExecComplex is QxQ and bridge maps to Complex;<br>CD bridge currently records no identification. Mathlib audit shows QuadraticAlgebra is coordinate-based and AdjoinRoot adjoins a root through a quotient pattern. Therefore the CNNA exact quadratic layer must be discriminant-indexed and proof-carrying, not a free sqrt(D). |
| Verification / audit            | Generated table;<br>no Lean build. Future verification in 1.2.1.1/1.2.1.2/4.0.3/CD9.                                                                                                                                                                                                                                                               |
| Next documentation action       | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty. Use LEG32 in Phase 1.1.1.1.1 module manifest before proposing scalar modules.                                                              |

### Object or quantity LEG32 – Derived-only exact quadratic provenance contract

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Documented                      | yes                                                                                                                                                                                                                                                                                                                              |
| Phase                           | 1.1.1.1.0.13                                                                                                                                                                                                                                                                                                                     |
| Source objects                  | LEG31, O00, O05/O06 plan, mathlib QuadraticAlgebra and AdjoinRoot reference docs, CD9 noncircularity rule                                                                                                                                                                                                                        |
| Definitions                     | No-free-sqrt scalar provenance contract. The exact quadratic layer is a relation-generated algebra over a derived D, not an axiom or analytic square root.                                                                                                                                                                       |
| Proof target                    | Prevent O09 from becoming a postulated algebraic-number source. Ensure every exact quadratic instance cites a proof-carrying D-source.                                                                                                                                                                                           |
| Proof sketch                    | Use dependency order: first operational Schur/DtN/charpoly/determinant produces D;<br>then O09 constructs a two-coordinate algebra with theta^2 = D;<br>then BR14 projects trace/norm/invariants. Missing D forces a backjump to O05/O06.                                                                                        |
| Verification / audit            | Planning lock only. Web/mathlib references support the construction pattern;<br>Lean implementation deferred to O09/O10/BR14 phases.                                                                                                                                                                                             |
| Next documentation action       | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty. During Phase 1.1.1.1.1, scalar-related module manifests must classify schema versus D-instantiation versus mirror proof. |

### Object or quantity O09 – Required exact quadratic operational scalar schema

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Documented                      | yes                                                                                                                                                                                                                                                                                                                                                                      |
| Phase                           | 1.1.1.1.0.14                                                                                                                                                                                                                                                                                                                                                             |
| Source objects                  | v36 phase table; object register; Phase 4.1 ExecBoundaryMatrix; M/SP/P/TM/N/L object groups                                                                                                                                                                                                                                                                              |
| Definitions                     | Planning contract separating Path A (number-theory/geometric/modular/analytic) from Path B (spectral/physical/transfer/late bridges).                                                                                                                                                                                                                                    |
| Proof target                    | Show that SP0/SP1/P00-P06 and TM0-TM2 do not require Phase 8/9 modular/j data as prerequisites, while M00-M07 belong to the modular path and L08/N16/N17 to analytic far targets.                                                                                                                                                                                        |
| Proof sketch                    | Compare each object’s Computed from/Natural provenance fields. Spectral/physical objects consume ExecBoundaryMatrix, finite matrix algebra, star/state/regime data; modular objects consume tau/lattice/Eisenstein/Delta/j; analytic far targets consume theta/chi_D/L-function data. Therefore the old linear chain imposed an artificial bottleneck and must be split. |
| Verification / audit            | Generated v37 phase/object tables must show M objects in Phase 8, analytic L/theta objects in Phase 9, and SP/P/TM objects in Phase 10 with no Phase 8/9 dependency unless a bridge explicitly records it.                                                                                                                                                               |
| Next documentation action       | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. During Phase 1.1.1.1.1 module manifest, verify proposed modules preserve this path split and do not import modular APIs into finite spectral/physical code.               |

### Object or quantity LEG34 – Phase-object-link policy contract

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Phase                           | 1.1.1.1.0.15                                                                                                                                                                                                                                            |
| Source objects                  | v37 phase table; object register; direct object map; phase hierarchy                                                                                                                                                                                    |
| Definitions                     | A phase has direct linked objects iff object.Phase equals phase.Phase. If the direct set is empty, the phase must declare scope_only, no_direct_object, or moved. Scope-only child objects may be displayed as a summary but do not transfer ownership. |

|                           |                                                                                                                                                                                                                                                                                                                                                                                                                  |
|---------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof target              | Every phase row in the generated table has an explicit object-link interpretation;<br>no blank Linked objects cell can be mistaken for missing plan data.                                                                                                                                                                                                                                                        |
| Proof sketch              | Compute direct objects from the object register, compute descendant object scope from the phase hierarchy, classify moved placeholders from routing text, classify direct phases by direct ownership, classify remaining descendant-bearing phases as scope-only, and classify the rest as no-direct-object audit/baseline/closeout. Validate that empty-direct phases are never rendered as unqualified blanks. |
| Verification / audit      | Generator validation fails if a phase declares direct ownership without direct objects, declares scope_only without child scope, or has an invalid policy kind. The phase table renders explanatory text instead of empty cells.                                                                                                                                                                                 |
| Next documentation action | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. During every future phase/object move, update the object Phase field and phase object-link policy together;<br>never leave a newly empty phase without explicit policy.                                           |

| Source objects                  | IDEAL_infty formal provenance whole;<br>subsystem/cut/approximant;<br>complement-family/regime split;<br>Schur/DtN effective operator path                                                                                                                                                                                                                                                                                                      |
| Definitions                     | Subsystem-being is the only primitive ontic emergence trigger: a finite/local subsystem, cut or approximant is selected inside IDEAL_infty. IDEAL_infty remains the formal relational/provenance whole. Boundary, inside/outside, complement families, regimes, operators, spectra, algebra, arithmetic, geometry, dynamics and physics are downstream derived consequences or comparison-only interpretations.                                 |
| Proof target                    | Prevent any phase from importing dynamics, physics, stochasticity, geometry, arithmetic, operator algebra, environment or unitarity as primitive data beyond subsystem-being.                                                                                                                                                                                                                                                                   |
| Proof sketch                    | Declare POST1 as global postulate. Route every later non-subsystem object through source-object chains beginning with cut/approximant and passing through boundary/regime/complement and Schur/DtN or a certified later bridge. Add GNG22 so missing structure forces backjump to the natural generating layer rather than consumer-side patching.                                                                                              |
| Verification / audit            | Generated global-postulate table, GNG22, workflow policy and LEG35 dossier must be present before active implementation. Future phase audits must state whether physical/arithmetic/geometric claims are derived or comparison-only.                                                                                                                                                                                                            |
| Next documentation action       | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty. When implementation starts, require the module manifest and proof dossiers to record the subsystem/cut provenance chain for every consumer that mentions dynamics, geometry, arithmetic, stochasticity, openness, unitarity or physics. |

Object or quantity DBR0 – Database-ready CNNA review and documentation structure

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat. |
| Documented                      | yes                                                                                                                                       |
| Phase                           | <a href="#">20.6</a>                                                                                                                      |

|                           |                                                                                                                                                                                                                                                                                                                                                     |
|---------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source objects            | Single YAML master;<br>generated_exports/*.tsv;<br>DBR0-DBR5;<br>context_documentation_profiles;<br>generate_context_doc.py.                                                                                                                                                                                                                        |
| Definitions               | A generated-secondary documentation packet that retains the official section topology but filters rows in each section by a query/profile relevance predicate. Each output includes a filter manifest and section hit summary.                                                                                                                      |
| Proof target              | Show that the slice generator is a reproducible view over existing YAML/export data only;<br>it does not edit Lean, does not introduce CNNA-generative objects, and visibly preserves expert-review/no-infallibility warnings.                                                                                                                      |
| Proof sketch              | The script loads cnna_roadmap_master.yaml, optional curated profiles, and generated TSV exports, computes relevance scores for rows, emits a manifest plus TeX/PDF view, and labels the output as generated-secondary. Because every row is copied from existing records, the slice is an index/filter view rather than a new semantic certificate. |
| Verification / audit      | V1.08 generator validates by running generate_tables.py first, then generate_context_doc.py for the dtn-matrix profile. The sample context_docs/dtn_matrix packet records matched/total rows per section and states the Lean-primary/expert-review warning.                                                                                         |
| Next documentation action | Use this function for targeted documentation requests and phase-closeout deltas. Add more curated profiles only when their term sets are reviewable and do not hide established-theory imports.                                                                                                                                                     |

| Phase                           | <a href="#">20.7</a>                                                                                                                                                                                                                                                                                                                                                |
| Source objects                  | Single YAML master;<br>repo inventory JSON;<br>generated exports;<br>DBR0-DBR6;<br>GNG23-GNG25.                                                                                                                                                                                                                                                                     |
| Definitions                     | A generated-secondary documentation layer that opens the full document with project facts, license notices, and an operational interface metaphor before embedding the repository module inventory and derivation graphs.                                                                                                                                           |
| Proof target                    | Show that the front Stats layer is a reproducible view over existing YAML/repo-inventory data and that the metaphor is explicitly bounded as non-ontological and non-theorematic.                                                                                                                                                                                   |
| Proof sketch                    | The generator computes counts from the YAML master and repo_inventory/raw_export JSON plus Lean file statistics, exports project_stats.generated.tsv, renders a compact Stats table, then includes the existing module inventory/graph view. The metaphor and license notices are stored as explicit YAML records and rendered as documentation, not as Lean input. |
| Verification / audit            | V1.09 validation runs generate_tables.py, checks the generated project_stats table and the full PDF, and confirms that the old standalone module-inventory section is removed from the main TeX while its content is embedded under Stats.                                                                                                                          |
| Next documentation action       | When a future database representation exists, map project_stats, guiding_metaphors, and license_notice into database tables/views without changing their generated-secondary status.                                                                                                                                                                                |

### Object or quantity LEG36 – Semantic module consolidation ledger

**Table legend.**   W = white/finished public object;     B = blue/proof-carrying but semantic/API correction still open;     G = green/locally closable;     Y = yellow/known route with prerequisites;     R = red/derivation layer incomplete or unclear;     K = black/registered side or future target.   Context class is orthogonal to status.

| Definitions                     | Compatibility-preserving merge/no-merge ledger for semantically related Lean modules. It distinguishes true duplicate/schema families from proof-stage chains where module granularity carries derivation provenance.                                                                                                                                                                                                                                                                                                                                                      |
| Proof target                    | Before any new substantive Lean implementation, close a bounded audit stating which module families should be consolidated, which require only facade aliases, which must remain separated, and which later refactor package may safely execute the changes.                                                                                                                                                                                                                                                                                                               |
| Proof sketch                    | Use the generated import/declaration inventory to identify module clusters, then spot-check candidate code. High-confidence candidates include clone-like BoundarySource substrate ledger modules and Handoff input/output schema aliases. Smoke/SM and Cayley-Dickson S6 chains are treated as no-merge-until-proven because their file boundaries encode proof/phase progression. Any accepted consolidation must preserve old imports through facades first, then record import graph delta, declaration delta, consumer breakage audit, and local full-build evidence. |
| Verification / audit            | V1.12 records the audit as an active gate, adds SCF43-SCF45, GNG26, RD08, a workflow row, and a report. No Lean source was moved. Local Lean build evidence is required for any later actual consolidation.                                                                                                                                                                                                                                                                                                                                                                |
| Next documentation action       | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. Run the active Phase 1.1.1.1.5 audit to fill the ledger with exact candidate rows and decide whether to open a bounded Lean refactor execution phase before returning to 1.1.1.2.                                                                                                                                                                                           |

### Object or quantity DBR8 – Root artifact retention and cleanup policy

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. | Phase                           | 20.8                                                                                                                                                                                                                                                                                                                                                                                     |
| Source objects                  | Single YAML master;<br>DBR0-DBR7;<br>GNG23-GNG27;<br>root artifact audit;<br>user instruction that PDFs/TeX need not be retained because they are regenerable.                                                                                                                                                                                                                           |
| Definitions                     | A generated-secondary repository hygiene layer: README.md stays in the project root, historical Markdown reports move to archive/reports/, and root PDF/TeX/LaTeX build products are deleted or regenerated on demand under a disposable output directory.                                                                                                                               |
| Proof target                    | Show that no root PDF/TeX/build products or historical reports are required as active sources and that the regeneration path remains explicit.                                                                                                                                                                                                                                           |
| Proof sketch                    | The YAML master and generated tables/exports are the maintained documentation data. Full PDFs and TeX wrappers can be reconstructed from scripts/generate_full_document.py after scripts/generate_tables.py. Historical Markdown reports are not needed for generation and are moved to archive/reports/ for traceability. The cleanup script enforces this classification mechanically. |
| Verification / audit            | V1.13 audits root file extensions, adds GNG27 and SCF46, adds generator/cleanup scripts, regenerates tables, verifies optional full-document compilation under generated_docs/full/, and removes root PDF/TeX/auxiliary artifacts from the packaged root.                                                                                                                                |
| Next documentation action       | For future releases, keep generated full PDFs/TeX out of the root package unless explicitly requested as a deliverable; use context docs or full doc generation on demand.                                                                                                                                                                                                               |

| Definitions                     | A concise README that explains the current repository layout, Lean-primary truth discipline, manual documentation commands, context-slice generation, ChatGPT-assisted workflow model, workflow extensibility, scalability vision, and license split.                                                                              |
| Proof target                    | Show that the README is an entry-point manual rather than a chronological changelog and that it does not misrepresent Claude as a tested/developed workflow component.                                                                                                                                                             |
| Proof sketch                    | Replace the old release-note-style README with a current manual. Keep generated artifacts secondary, keep Lean-code primary, state that the integrated assistant workflow was developed/tested with ChatGPT, and present Claude or other tools only as external review/discussion channels if used outside this validated package. |
| Verification / audit            | V1.14 rewrites README.md, updates metadata/latest-change records, regenerates YAML-derived exports with generate_tables.py, and checks that no Lean source was modified.                                                                                                                                                           |
| Next documentation action       | Keep README as compact current manual. Move detailed historical notes to archive/reports or generated documentation rather than re-growing a chronological README.                                                                                                                                                                 |

| Documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                                                                                                                                                                            |
| Documented                      | yes                                                                                                                                                                                                                                                                                                                                                                  |
| Phase                           | 20.10                                                                                                                                                                                                                                                                                                                                                                |
| Source objects                  | DBR8 root artifact retention policy;<br>uploaded root Lean/Lake files;<br>repo_snapshot/CNNA source tree;<br>README/manual build commands.                                                                                                                                                                                                                           |
| Definitions                     | A package-root build-control set: CNNA.lean top-level compatibility import file, lakefile.lean package definition pointing the CNNA library at Repository/repo_snapshot, lake-manifest.json dependency lock, and lean-toolchain Lean version pin.                                                                                                                    |
| Proof target                    | Show that root cleanup must distinguish generated documentation artifacts from Lean/Lake source-control files, preserving the latter for reproducible local builds.                                                                                                                                                                                                  |
| Proof sketch                    | The V1.13/V1.14 cleanup policy correctly removed generated PDF/TeX/report clutter, but over-stated the root invariant as README-only. The corrected invariant retains README.md plus the four Lean/Lake project-control files. The cleanup script keep-list is amended so future root hygiene does not delete build configuration.                                   |
| Verification / audit            | V1.15 copies the uploaded root files into the package root above Repository/, updates README and YAML records, amends clean_generated_root_artifacts.py defensively, regenerates tables/exports, runs cleanup inside Repository/, and checks that the package root contains the Lean/Lake build-control files while Repository root has no PDF/TeX/LaTeX byproducts. |
| Next documentation action       | If further root source-control files become necessary, classify them explicitly in DBR10/GNG28 rather than broadening the root policy to arbitrary artifacts.                                                                                                                                                                                                        |

| Documented                      | yes                                                                                                                                                                                                                                                                                                                                                    |
| Phase                           | 20.11                                                                                                                                                                                                                                                                                                                                                  |
| Source objects                  | DBR8 root artifact policy;<br>DBR9 README surface;<br>DBR10 Lean/Lake build-entry files;<br>user licensing URLs and credit/minimum-requirement instructions.                                                                                                                                                                                           |
| Definitions                     | The maintained README is a root-only manual;<br>LICENSE is a root-only legal notice file with dual project-authored license scopes;<br>generated PDFs carry explicit Editor and Assistant credits;<br>the tested assistant workflow states its minimum ChatGPT Plus/GPT-5.5 requirement.                                                               |
| Proof target                    | Show that the package root exposes the legal/documentation entry surface without duplicating README files and that generated PDFs visibly include the requested credits.                                                                                                                                                                               |
| Proof sketch                    | Separate legal/source-control files from generated artifacts: README.md and LICENSE are source/control documentation in root;<br>generated PDF/TeX files are disposable under generated_docs/full/ or context_docs/. Update generator author fields and stats metadata so PDF output carries the same credit semantics without becoming primary truth. |
| Verification / audit            | V1.17 removes Repository/README.md and repo_inventory/raw_export/README.md, adds root LICENSE, updates root README, regenerates tables, compiles a full PDF with the new title/author credits, regenerates context documentation, and audits that README.md appears only in package root.                                                              |
| Next documentation action       | If multilingual README or alternative assistant workflows are later validated, add them as explicit output/workflow layers rather than weakening the current English-first, ChatGPT-tested statement.                                                                                                                                                  |

| Documented                      | yes                                                                                                                                                                                                                                                                                                   |
| Phase                           | 20.13                                                                                                                                                                                                                                                                                                 |
| Source objects                  | Status legend;<br>pre-implementation phase check workflow;<br>implementation scratchpad phase_type;<br>user red/yellow/orange/white policy requirement;<br>Lean-primary and derived-only guardrails.                                                                                                  |
| Definitions                     | G = closed;<br>Y = unique active implementable phase;<br>O = implementable after named predecessor closure;<br>R = locked Lean-derivation phase lacking release proof;<br>W = non-direct Lean derivation work such as refactor, tool, infrastructure, documentation, or comparison.                   |
| Proof target                    | Show that the planning table now encodes default red locking for unreleased Lean-derivation phases and that white no longer means unchecked Lean derivation.                                                                                                                                          |
| Proof sketch                    | Use implementation_scratchpad.phase_type as the classification seam. Convert all W/derivation phases to R. Keep W for refactor/infrastructure/documentation/comparison phases. Patch generator validation so a W derivation phase fails generation and exactly one Y phase remains the active cursor. |
| Verification / audit            | V1.19 converts 81 derivation phases from W to R, keeps the active phase 1.1.1.1.5 yellow and 1.1.1.2 orange, regenerates tables, compiles representative PDFs, and checks status counts.                                                                                                              |
| Next documentation action       | For any red phase, add a pre-implementation check that references the prerequisite derived-only Lean objects before changing it to yellow or orange.                                                                                                                                                  |

| Documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                                                                                                                                             |
| Documented                      | yes                                                                                                                                                                                                                                                                                                                                   |
| Phase                           | 20.14                                                                                                                                                                                                                                                                                                                                 |
| Source objects                  | DBR6 context documentation generator;<br>DBR12 section-pagebreak layout;<br>DBR13 phase-status release policy;<br>user clarification about module-manifest confusion and section/table explanations.                                                                                                                                  |
| Definitions                     | A documentation generator policy in which static section prose explains what data is shown, where it comes from and why it is displayed;<br>only table rows remain dynamic. The old implementation module manifest is renamed and moved to a technical appendix for actual module/API changes only.                                   |
| Proof target                    | Show that full and context documentation now explain major sections without creating a second phase table or duplicating release logic.                                                                                                                                                                                               |
| Proof sketch                    | Patch full generator section text, context generator section descriptions/order, and module-manifest static paragraph. Move the module-change manifest after phase table and scratchpad in the full document. Keep all table contents generated from YAML/exports. Validate with table generation and representative PDF compilation. |
| Verification / audit            | V1.20 regenerates tables, compiles full PDF and DtN context PDF, checks generated TeX for new section titles/explanations, renders representative pages, and verifies no Lean source under repo_snapshot/CNNA changed.                                                                                                                |

|                           |                                                                                                                               |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------|
| Next documentation action | If later sections become too verbose, trim static prose in generators rather than moving explanations into dynamic YAML rows. |
|---------------------------|-------------------------------------------------------------------------------------------------------------------------------|

| Phase                           | 1.1.1.1.5.1                                                                                                                                                                                                                                                                                                                                     |
| Source objects                  | LEG10, LEG5, repo_inventory/raw_export/modules.json, symbol_reference_summary.json, module/declaration consumption TSVs.                                                                                                                                                                                                                        |
| Definitions                     | A complete classification ledger for the current Lean source snapshot: every module/declaration is linked to an object/proof dossier, legacy/audit-only bucket, tool/refactor bucket, or a newly created natural-origin ingestion phase.                                                                                                        |
| Proof target                    | Close the corresponding pre-substantive-code readiness condition before new Lean content implementation is released.                                                                                                                                                                                                                            |
| Proof sketch                    | Use generated inventory, direct source scan, object/proof-dossier register and local build evidence where required. If the condition cannot be closed, create or refine an upstream red blocker at the natural source layer instead of patching a consumer phase.                                                                               |
| Verification / audit            | V1.21 creates the readiness sequence and records the gap explicitly. Closure requires future local Lean/build/inventory evidence; no Lean source is changed in V1.21.                                                                                                                                                                           |
| Next documentation action       | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. Fill with exact candidate rows and evidence during the corresponding child phase; do not mark 1.1.1.2 active until this dossier chain is closed. |

| Proof sketch                    | Keep Lean/YAML as source;<br>export snapshots into DB;<br>expose only read-only public views;<br>preserve snapshot provenance and checksums;<br>forbid browser service_role keys and public writes;<br>keep admin/import writes local or later signed/admin-only.                                                                                                  |
| Verification / audit            | Planned. Closure requires schema/import/RLS/frontend contract review, no secrets in repo/chat, and roundtrip/export evidence. V1.22 records planning objects only.                                                                                                                                                                                                 |
| Next documentation action       | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. When the pre-code gate stabilizes or DB work becomes active, create migration/importer artifacts and a Supabase context documentation slice from these DBR records. |

### Object or quantity DBR19 – cnna-project.net web-frontend data contract

**Table legend.** W = white/finished public object;   B = blue/proof-carrying but semantic/API correction still open;   G = green/locally closable;   Y = yellow/known route with prerequisites;   R = red/derivation layer incomplete or unclear;   K = black/registered side or future target. Context class is orthogonal to status.

| Significance tier               | F3                                                                                                                                                                                                                                                                                                                 |
| Documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                                                                                                                          |
| Documented                      | yes                                                                                                                                                                                                                                                                                                                |
| Phase                           | 20.21                                                                                                                                                                                                                                                                                                              |
| Source objects                  | DBR12 section-pagebreak layout invariant;<br>DBR14 documentation section explanations;<br>DBR21 typography request;<br>existing full/context/table generators.                                                                                                                                                     |
| Definitions                     | Full and context PDF generators use 11pt A3 landscape document classes;<br>generated table fragments bump explicit TeX sizes one step: scriptsize to footnotesize, footnotesize to small, small to normalsize, tiny to scriptsize;<br>generated graph labels are bumped by one point where controlled by the tool. |
| Proof target                    | Show that PDF typography enlargement is implemented at generator level and does not edit disposable PDF outputs or change Lean/YAML row semantics.                                                                                                                                                                 |
| Proof sketch                    | Patch generator sources, regenerate tables/exports, compile representative full/context PDFs, inspect generated TeX for bumped size commands and render early pages to ensure no obvious clipping/black-glyph failure.                                                                                             |
| Verification / audit            | V1.23 regenerates tables, compiles the full PDF and a Supabase context PDF, checks generated TeX for documentclass[11pt] and larger table size commands, renders representative pages, and audits no Lean source under repo_snapshot/CNNA changed.                                                                 |
| Next documentation action       | If readability still needs adjustment, add an explicit PDF typography profile table instead of ad-hoc per-table changes.                                                                                                                                                                                           |

| Source objects                  | DBR15-DBR20;<br>GNG34;<br>live Supabase discovery;<br>Master YAML;<br>generated_exports;<br>repo_inventory/raw_export.                                                                                                                                                                                                                   |
| Definitions                     | Produce the first migration package for internal/api/review/admin schemas, internal canonical tables, api read-only views, grants/RLS posture, and comments documenting non-truth-source status.                                                                                                                                         |
| Proof target                    | Planned tooling artifact. No live migration is applied until explicit user authorization.                                                                                                                                                                                                                                                |
| Proof sketch                    | Keep DB activation as generated-secondary tooling: every imported row carries snapshot/provenance, public access is read-only, writes require explicit authorization, and no Lean source file is changed.                                                                                                                                |
| Verification / audit            | For 20.22: read-only Supabase organization/project/table discovery only. For later phases: require migration/import report, checksum report, advisor output and public-read-only tests.                                                                                                                                                  |
| Next documentation action       | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. After explicit authorization, record actual migration/import result and compare live DB inventory against planned schema/import contract. |

### Object or quantity DBR24 – Supabase snapshot import package from YAML/generated exports

**Table legend.** W = white/finished public object;   B = blue/proof-carrying but semantic/API correction still open;   G = green/locally closable;   Y = yellow/known route with prerequisites;   R = red/derivation layer incomplete or unclear;   K = black/registered side or future target. Context class is orthogonal to status.

| Phase                           | <a href="#">20.25</a>                                                                                                                                                                                                                                                                                                                    |
| Source objects                  | DBR15-DBR20;<br>GNG34;<br>live Supabase discovery;<br>Master YAML;<br>generated_exports;<br>repo_inventory/raw_export.                                                                                                                                                                                                                   |
| Definitions                     | Execute, only after explicit user authorization, the schema migration and first data import into Supabase project aiekahdewadrejrrdajn using controlled admin/tool write path.                                                                                                                                                           |
| Proof target                    | Future live DB-write phase. It writes only Supabase schema/data, never Lean files, and must produce migration/import reports.                                                                                                                                                                                                            |
| Proof sketch                    | Keep DB activation as generated-secondary tooling: every imported row carries snapshot/provenance, public access is read-only, writes require explicit authorization, and no Lean source file is changed.                                                                                                                                |
| Verification / audit            | For 20.22: read-only Supabase organization/project/table discovery only. For later phases: require migration/import report, checksum report, advisor output and public-read-only tests.                                                                                                                                                  |
| Next documentation action       | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. After explicit authorization, record actual migration/import result and compare live DB inventory against planned schema/import contract. |

### Object or quantity DBR26 – Post-import read-only/RLS/advisor verification and web-frontend handoff

**Table legend.** W = white/finished public object;   B = blue/proof-carrying but semantic/API correction still open;   G = green/locally closable;   Y = yellow/known route with prerequisites;   R = red/derivation layer incomplete or unclear;   K = black/registered side or future target. Context class is orthogonal to status.

| Significance tier               | F2                                                                                                                                                                                                                                                   |
| Documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                                                        |
| Documented                      | no                                                                                                                                                                                                                                                   |
| Phase                           | 18.5                                                                                                                                                                                                                                                 |
| Source objects                  | GA0-GA5 and future derived CNNA outputs; never from external GA as a foundation.                                                                                                                                                                     |
| Definitions                     | A side-comparison register for geometric algebra, spacetime algebra and conformal geometric algebra as external target surfaces for already-derived CNNA outputs.                                                                                    |
| Proof target                    | Future proof/documentation target: show that the referenced CNNA-derived objects satisfy or fail the external target profile, with the external source classified as comparison-only and with no handoff rights.                                     |
| Proof sketch                    | Current state is a reference-gate scratchpad, not a Lean proof. Implementation must first expose CNNA-derived predecessor data, then encode the comparison profile structurally and prove/falsify it without importing external theory as generator. |
| Verification / audit            | No Lean code introduced in V1.25; generator validation and table/PDF generation are the only checks. Expert review required before implementation.                                                                                                   |
| Next documentation action       | When phase 18.5 becomes implementable, replace this placeholder with exact Lean module/declaration links and sign/provenance audit.                                                                                                                  |

### Object or quantity DBR27 – Phase/Object context-class taxonomy

**Table legend.** W = white/finished public object; B = blue/proof-carrying but semantic/API correction still open; G = green/locally closable; Y = yellow/known route with prerequisites; R = red/derivation layer incomplete or unclear; K = black/registered side or future target. Context class is orthogonal to status.

| Field                           | Record                                                                                                                                                                                                                                               |

| Object ID                       | DBR27                                                                                                                                                                                                                                                |
| Object status                   | G                                                                                                                                                                                                                                                    |
| Context class                   | ToolInfrastructureObject                                                                                                                                                                                                                             |
| Significance tier               | F3                                                                                                                                                                                                                                                   |
| Documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                                                            |
| Documented                      | yes                                                                                                                                                                                                                                                  |
| Phase                           | 20.27                                                                                                                                                                                                                                                |
| Source objects                  | LEG34;<br>DBR13;<br>status_legend;<br>phase_object_link_policy;<br>object register;<br>phase table;<br>user-requested OOP-style class separation                                                                                                     |
| Definitions                     | PhaseContextClass and ObjectContextClass are orthogonal metadata fields. They identify Lean/tool/reference/database/generated/governance/documentation class boundaries while Object status and Phase status continue to encode release/proof state. |

|                           |                                                                                                                                                                                                                                                                                                                                              |
|---------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof target              | Complete register coverage and visible rendering: every phase/object has exactly one context class from the taxonomy, and generated phase/object/proof/scratchpad tables show the class beside status-sensitive fields.                                                                                                                      |
| Proof sketch              | Generated schema enforces non-empty Context class on phases and objects. The taxonomy is rendered before phase/object registers. Second-pass semantic audit separates LeanSourceObject/LeanTargetObject from LeanRefactorObject, LeanHandoffContractObject, LeanGovernanceObject and non-Lean tool/reference/database/documentation classes. |
| Verification / audit      | python3 scripts/generate_tables.py validates presence of context_class_taxonomy and Context class fields;<br>PDF generation renders the taxonomy and all phase/object tables with Context class columns. No Lean source is changed by this tooling/schema phase.                                                                             |
| Next documentation action | Mirror context classes into future Supabase schema and require future phase/object additions to declare a class at creation time.                                                                                                                                                                                                            |

18 Phase table in natural derivation order

**What this section shows.** This is the primary roadmap table. It is the authoritative generated view for phase status, dependencies, linked objects, current code sites, target modules/objects, proof goals and implementation scratchpad links. Lean-derivation phases are red by default until released by derived-only object evidence; yellow is the unique active phase; orange is implementable after stated predecessor closure; white is reserved for non-direct-Lean tooling, infrastructure, documentation, comparison or refactor work.

**Phase table rule.** This is the primary roadmap and release table. Green means closed/derived-only or governance-closed. Yellow is the unique active implementable phase. Orange means implementable only after the stated predecessor closure. Red is the default for unreleased Lean-derivation phases until they cite sufficient derived-only object/proof evidence. White is reserved for non-direct-Lean tooling, infrastructure, documentation, comparison, packaging, or refactor work. Context class is the orthogonal type/class field; Phase documentation tier is the orthogonal documentation-depth field: it distinguishes LeanDerivationPhase/LeanRefactorPhase from ToolInfrastructurePhase, DatabaseMirrorPhase, ReferenceGatePhase and generated/documentation classes. The module-change appendix must never replace this release logic.

Single phase table: derivation order, dependencies, code sites, proof goals, and implementation links

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

|     | Phase                                             | Status   | Context class                     | Doc tier | Linked objects                                                                                                                                                                                                                                      | Main goal                                                                                                                       | Source objects/<br>dependencies                                         | Definitions/objects                                                                                                                                                                                                                            | Current code modules                                                                                                                        | Target modules/<br>objects                                                                                                                                                                                            | Proof goals                                                                                                                                                                                                                                                                                                                  | How imple-<br>mented                   |

Promote the operational no-go list from phase-local scratchpad content to a global invariant that applies to every phase and every future code-edit prompt. Close this before module-manifest implementation starts so no child phase can silently weaken the rules.                                                                  | <a href="#">implemented record</a> |

| Phase   | Status | Context                       | class | Doc tier | Linked objects                                | Main goal                                                                               | Source objects/<br>dependencies                                                                                                                                              | Definitions/objects                                                                                                                                                                                                                                                                   | Current code modules                                                                                          | Target modules/<br>objects                                                                                                                                           | Proof goals                                                                                                                                                                                                                                                                                                                                                                                  | How imple-<br>mented               |

No Lean source is changed in this gate. Include generic finite test placement for upcoming computation modules; special sentinel tests are insufficient. The manifest must also decide where regime-tagged generic rows, noOuter-root sentinel rows, and HasOuter/ complement-projection comparison rows live without duplicating the generator. Scalar modules must distinguish parameterized schema from proof-carrying D-instantiation. The manifest must also state whether the target implementation phase owns direct objects, consumes child-scope objects, or is objectless infrastructure under the global phase-object-link policy. | <a href="#">implemented record</a> |

19 Implementation scratch pad

**What this section shows.** This section records how each phase was prepared, implemented or closed. It is the detailed audit trail behind the phase table: changed files, proof strategy, expected tactics, build status, no-go checks, dependency audit and post-implementation notes. It is shown after the phase table because it explains the evidence behind phase-state changes.

Phase 0 – Freeze the SM9h baseline unchanged

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                  | completed                                                                                                                                                                                                                  |
| Preparation status                     | completed-baseline-freeze                                                                                                                                                                                                  |
| Phase type                             | baseline                                                                                                                                                                                                                   |
| Phase-type-specific contract           | Freeze/reference phase: record source package and do not introduce new code.                                                                                                                                               |
| Title / state                          | implemented / closed                                                                                                                                                                                                       |
| Preparation workflow                   | No source-preparation workflow was needed. The phase freezes the last locally green SM9h package as immutable baseline evidence.                                                                                           |
| Source-to-CNNA mapping                 | Existing SM9h modules are not renamed in the baseline. They are mapped as legacy derivation sites and later wrapped by neutral target modules.                                                                             |
| Dependency-depth audit                 | No new dependencies are introduced. Baseline freeze depends only on user-confirmed green SM9h code and static package inspection.                                                                                          |
| Phase split decision                   | No split. This is a governance freeze, not a mathematical implementation phase.                                                                                                                                            |
| Positive path plan                     | Preserve the green baseline and build neutral wrappers later instead of mutating historical modules.                                                                                                                       |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                           |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation  | Not a Lean proof phase. The rehearsal is architectural: treat SM9h as immutable input and verify that later phases consume it through neutral interfaces.                                                                  |
| Expected tactics                       | None;<br>no Lean proofs are added in phase 0.                                                                                                                                                                              |
| Expected mathlib imports               | None added.                                                                                                                                                                                                                |
| ExecComplex/computable plan            | ExecComplex baseline is preserved;<br>no analytic or mirror replacement is introduced.                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                        |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                    |
| Expected executable witness            | not specified yet                                                                                                                                                                                                          |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                       |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                  |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bridge gap status                    | No bridge gap is closed here. Known gaps are registered for later phases.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Natural backjump/refactor layer      | If a later neutral wrapper cannot consume SM9h cleanly, backjump to the neutral interface phase, not to this frozen baseline.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Implementation prompt contract       | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| How implemented                      | The SM9h code package is treated as a frozen baseline. No new Lean declarations are introduced in this phase. The existing historical modules remain unchanged and are referenced only as legacy derivation sites. Part 2 will add neutral wrapper/import surfaces later instead of renaming or editing the frozen baseline directly.                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Verification / evidence              | Baseline object is the provided green SM9h package. Current derivation sites include CNNA/PillarA/Arithmetic/BuildAll.lean, Smoke/* through GeneratedOperationalQuadraticDiscriminantSourceFromSM9g1Window.lean, plus the already existing Schur, DtN, Finite, Handoff, and Cayley-Dickson legacy modules. I did not run Lean in this environment; the green status is taken from the supplied/local confirmed baseline and static inspection.                                                                                                                                                                                                                                                                                                                                                       |
| Post-implementation plan check       | Closed as governance baseline: no code mutation, no new formulas, no new consumer access, no Lean build run by assistant.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Artifact packaging rule              | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Implementation notes                 | This record is deliberately non-code: it documents freeze semantics. Any later refactor must preserve import compatibility and must not mutate the Part 1 baseline.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

### Phase 1 – Neutral code surface umbrella; decomposition and active branch fixed before object intake and new mathematics

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                     |
| Implementation status                 | completed                                                                                                                                                                                               |
| Preparation status                    | decomposition-closed                                                                                                                                                                                    |
| Phase type                            | refactor                                                                                                                                                                                                |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                               |
| Title / state                          | Neutral code surface before object intake and new mathematics                                                                                                                                                                                                         |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                           |
| Source-to-CNNA mapping                 | Umbrella phase: does not itself introduce public declarations. Descendant phases map legacy code to neutral surfaces.                                                                                                                                                 |
| Dependency-depth audit                 | Phase 0 is closed. This umbrella is intentionally not active because it mixes notation, foundation, regime, and CD wrapper work.                                                                                                                                      |
| Phase split decision                   | Split required. Phase 1 decomposes into 1.1 notation/legacy quarantine, 1.2 foundation/generator, 1.3 regime/complement, 1.4 CD structural reintegration.                                                                                                             |
| Positive path plan                     | Implement descendants in order. Never start Phase 5/number theory or Phase 3 Schur/DtN before 1.1 import firewall and relevant foundation/regime wrappers are closed.                                                                                                 |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | Umbrella has no Lean proof. Descendants must use definitional forwarding, constructors, field projections, and import checks.                                                                                                                                         |
| Expected tactics                       | n/a for umbrella; descendant records specify tactics.                                                                                                                                                                                                                 |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                               |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                              |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                  |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                                                           |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                              |
| How implemented                        | Planning/decomposition closure only: the child DAG, ordering rule, and active cursor were fixed in the YAML master. No Lean refactor or theorem implementation is claimed for this umbrella row.                                                                      |
| Verification / evidence                | Generated YAML/table/PDF validation for the governance decomposition. Lean build was not run in this environment.                                                                                                                                                     |
| Build result                           | No Lean build run; governance/documentation-only closure.                                                                                                                                                                                                             |
| Post-implementation plan check         | Satisfied as a routing/order lock: no white predecessor remains on the active branch before the unique yellow active phase.                                                                                                                                           |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Green here means decomposition-closed umbrella. Descendant implementation phases remain responsible for code movement and proof closure.                                                                                                                              |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Extracted established theory objects | <ul style="list-style-type: none"> <li>umbrella refactor only; closed by descendants 1.1-1.4</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| No-go guardrails                     | <ul style="list-style-type: none"> <li>GLOBAL-INHERITED: top-level global <code>_no_go_guardrails</code> apply; this phase list is local addenda only.</li> <li>no <code>@[simp]</code> attributes in the operational path</li> <li>no <code>noncomputable</code> in the operational path</li> <li>no classical helper unless isolated in allowed mirror/non-operational layer</li> <li>no <code>Matrix.inv</code> or external inverse oracle in operational derivations</li> <li>no free formula without proof-carrying entry structure</li> <li>no consumer-side patch when the missing structure belongs earlier</li> <li>no premature obstruction before a serious positive construction attempt</li> <li>no phase-semantic public API names</li> <li>no fragile rewrite chain when a structural constructor/projection proof is available</li> <li>do not delete legacy status enums during quarantine</li> <li>do not let Phase 3+ import <code>Legacy.StatusGates</code></li> <li>do not treat old TeX/PDF files as maintained roadmap sources</li> </ul> |

**Phase 1.1 – Notation split and legacy/API cleanup umbrella; child gates fixed in derivation order**

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                    | decomposition-closed                                                                                                                                                                                    |
| Phase type                            | infrastructure                                                                                                                                                                                          |
| Phase-type-specific contract          | Infrastructure/planning phase: justify absence of operational witness; close schema/decision prerequisites before code.                                                                                 |
| Title / state                         | Notation split and legacy-status quarantine                                                                                                                                                             |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.             |
| Source-to-CNNA mapping                | LEG0 is produced first. LEG1-LEG4 consume LEG0 in sequence. Mathematical objects are not introduced in this branch.                                                                                     |
| Dependency-depth audit                | Dependencies for preparation are complete, but implementation depth is mixed: inventory, quarantine, notation extraction, alias routing, import firewall.                                               |
| Phase split decision                  | Split into 1.1.1-1.1.5. Keeping all of this in one phase would create an oversized refactor and obscure import failures.                                                                                |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positive path plan                     | Close the split map first;<br>then quarantine status gates;<br>then create CoreSymbols;<br>then route aliases/wrappers;<br>finally run the import firewall audit.                                                                                                     |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                           |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | Mostly no mathematical proofs. Expected Lean work is module movement, reexports, definitional aliases, exact forwarding, and import graph verification.                                                                                                               |
| Expected tactics                       | exact, rfl, constructor, field projections, named theorem forwarding;<br>avoid broad simp/simpa except final trivial closure.                                                                                                                                         |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                            |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00;<br>preserve existing computability boundaries.                                                                                                                                           |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected;<br>missing names/imports must be localized to the natural source/split layer.                                                                                                                                                        |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Planning/decomposition closure only: the child DAG, ordering rule, and active cursor were fixed in the YAML master. No Lean refactor or theorem implementation is claimed for this umbrella row.                                                                      |
| Verification / evidence                | Generated YAML/table/PDF validation for the governance decomposition. Lean build was not run in this environment.                                                                                                                                                     |
| Build result                           | No Lean build run;<br>governance/documentation-only closure.                                                                                                                                                                                                          |
| Post-implementation plan check         | Satisfied as a routing/order lock: no white predecessor remains on the active branch before the unique yellow active phase.                                                                                                                                           |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Green here means decomposition-closed umbrella. Descendant implementation phases remain responsible for code movement and proof closure.                                                                                                                              |

### Phase 1.1.1 – Pre-code governance umbrella: module manifest, reuse, consumption classification, proofbook infrastructure, blue correction, API and pruning gates

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                  |

| Preparation status                    | decomposition-closed                                                                                                                                                                                    |
| Phase type                            | documentation                                                                                                                                                                                           |
| Phase-type-specific contract          | Documentation phase: record dossier coverage, verification/audit status, and links to code/object records; no mathematical object is generated by documentation alone.                                  |
| Title / state                         | Consumption classification and blue-object correction umbrella                                                                                                                                          |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.             |
| Source-to-CNNA mapping                | This umbrella binds LEG0/LEG5/LEG6/LEG7/LEG8/LEG9. It prevents code moves before consumption and semantic API roles are classified.                                                                     |
| Dependency-depth audit                | Too broad for one implementation step; split into 1.1.1.1-1.1.1.5.                                                                                                                                      |
| Phase split decision                  | Split required by v23: classification, blue correction ledger, public API contract, pruning ledger, generated-view lock.                                                                                |
| Positive path plan                    | Proceed through child gates only. No deletion, wrapper move, or status quarantine until classification and contracts exist.                                                                             |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.       |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.             |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                              |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No Lean proof. Structural validation only: exactly one active child, complete scratchpad records, generated tables/PDF compile.                                                                                                                                       |
| Expected tactics                       | No Lean tactics expected. If a small Lean audit module is later added, use only constants/strings/records with exact/rfl where applicable.                                                                                                                            |
| Expected mathlib imports               | No new mathlib imports. No Lean imports are required for this planning/audit gate.                                                                                                                                                                                    |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                              |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                                                           |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Planning/decomposition closure only: the child DAG, ordering rule, and active cursor were fixed in the YAML master. No Lean refactor or theorem implementation is claimed for this umbrella row.                                                                      |
| Verification / evidence                | Generated YAML/table/PDF validation for the governance decomposition. Lean build was not run in this environment.                                                                                                                                                     |
| Build result                           | No Lean build run;<br>governance/documentation-only closure.                                                                                                                                                                                                          |
| Post-implementation plan check         | Satisfied as a routing/order lock: no white predecessor remains on the active branch before the unique yellow active phase.                                                                                                                                           |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Green here means decomposition-closed umbrella. Descendant implementation phases remain responsible for code movement and proof closure.                                                                                                                              |

**Phase 1.1.1.1 – Module/declaration consumption classification umbrella with architecture-decision locks, pre-implementation module manifest, reuse governance, and proofbook ordering**

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                                                                                                                   |
| Context class                         | DocumentationPhase                                                                                                                                                                                                                                  |
| Phase documentation tier              | F0                                                                                                                                                                                                                                                  |
| Phase documentation depth requirement | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty.                                             |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                  |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                 |
| Implementation status                 | completed                                                                                                                                                                                                                                           |
| Preparation status                    | decomposition-closed                                                                                                                                                                                                                                |
| Phase type                            | documentation                                                                                                                                                                                                                                       |
| Phase-type-specific contract          | Documentation phase: record dossier coverage, verification/audit status, and links to code/object records; no mathematical object is generated by documentation alone.                                                                              |
| Title / state                         | module/declaration classification umbrella with module-manifest and reuse governance                                                                                                                                                                |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.                                                                            |
| Source-to-CNNA mapping                | This umbrella maps code hygiene to LEG10, LEG11, and LEG5. It no longer directly closes declaration classification.                                                                                                                                 |
| Dependency-depth audit                | Split required. Module placement/reuse must be decided before declaration classification, because whether code belongs in an existing module is part of semantic consumption.                                                                       |
| Phase split decision                  | Split into 1.1.1.1.1 module manifest, 1.1.1.1.2 reuse/generator audit, and 1.1.1.1.3 proof-documentation infrastructure and 1.1.1.1.4 declaration classification finalization.                                                                      |
| Positive path plan                    | Close 1.1.1.1.1 first;<br>then reuse/generator audit;<br>then classify declarations using the two governance ledgers.                                                                                                                               |
| Module implementation manifest        | Umbrella only. Child 1.1.1.1.1 defines the required manifest format.                                                                                                                                                                                |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                          |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                  |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | No Lean proof in umbrella. Treat as planning contract.                                                                                                                                                                                                                |
| Expected tactics                       | No Lean tactics expected. If the classification is mirrored in Lean later, use explicit records and exact/rfl;<br>no simp-driven folding.                                                                                                                             |
| Expected mathlib imports               | No new mathlib imports expected;<br>if a later Lean audit file is introduced, verify imports against mathlib 4.28.0 first.                                                                                                                                            |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                                                                |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | A declaration family with unclear usage is a classification gap, not a proof gap. It must block movement/deletion until classified.                                                                                                                                   |
| Natural backjump/refactor layer        | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                                                              |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | Planning/decomposition closure only: the child DAG, ordering rule, and active cursor were fixed in the YAML master. No Lean refactor or theorem implementation is claimed for this umbrella row.                                                                      |
| Verification / evidence                | Generated YAML/table/PDF validation for the governance decomposition. Lean build was not run in this environment.                                                                                                                                                     |
| Proof strategy                         | Use green architecture locks through 1.1.1.1.0.14 before active module implementation;<br>then classify modules/declarations.                                                                                                                                         |
| Build result                           | No Lean build run;<br>governance/documentation-only closure.                                                                                                                                                                                                          |
| Post-implementation plan check         | Satisfied as a routing/order lock: no white predecessor remains on the active branch before the unique yellow active phase.                                                                                                                                           |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | Green here means decomposition-closed umbrella. Descendant implementation phases remain responsible for code movement and proof closure.                                                                                                                              |
| Source materials / references          | <ul style="list-style-type: none"> <li>repo_inventory/raw_export</li> <li>Arithmetic/Notation.lean audit</li> <li>symbol/reference summary</li> <li>existing Smoke-Test Generator modules</li> </ul>                                                                  |

### Phase 1.1.1.1.0 – Global no-go guardrail contract and inheritance lock

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                  |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                                                                       |
| Context class                         | LeanGovernancePhase                                                                                                                                                                                     |
| Phase documentation tier              | F0                                                                                                                                                                                                      |
| Phase documentation depth requirement | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                      |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                     |
| Implementation status                 | completed                                                                                                                                                                                               |
| Preparation status                    | completed                                                                                                                                                                                               |
| Phase type                            | infrastructure                                                                                                                                                                                          |
| Phase-type-specific contract          | Infrastructure/planning phase: justify absence of operational witness; close schema/decision prerequisites before code.                                                                                 |
| Title / state                         | Global no-go guardrail contract and inheritance lock                                                                                                                                                    |
| Preparation workflow                  | Global guardrail infrastructure insertion before active implementation phase.                                                                                                                           |
| Source-to-CNNA mapping                | User global no-go list -> LEG13;<br>workflow inheritance -> <code>workflow_policy</code> ;<br>phase enforcement -> <code>implementation_scratchpad.global__no_go_inheritance</code> .                   |
| Dependency-depth audit                | Must precede 1.1.1.1.1 because module manifests and all later implementation prompts need the global constraints already active.                                                                        |
| Phase split decision                  | Inserted as 1.1.1.1.0 rather than merging into 1.1.1.1.1 because guardrail inheritance is a cross-cutting invariant, not module-manifest content.                                                       |
| Positive path plan                    | Close global guardrail infrastructure first, then continue with compact module manifest and semantic placement gate.                                                                                    |
| Module implementation manifest        | No code modules introduced by this gate.                                                                                                                                                                |
| Semantic placement decision           | Governance belongs in YAML master and generated views unless a future code-level policy module is justified.                                                                                            |
| Reuse and duplication audit           | No duplicate implementation authorized; decision reduces future duplication risk.                                                                                                                       |
| Canonical generator policy            | Generator-like logic must consume the canonical smoke/theory generator path; no parallel implementation.                                                                                                |
| Module compactness rule               | Do not split code solely for this planning decision; use YAML/workflow unless a reusable code-level policy module is later justified.                                                                   |

|                                        |                                                                                                                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation  | If every scratchpad record carries global_no_go_inheritance and generator renders top-level guardrails, local no_go fields cannot be interpreted as exhaustive phase-only rules.                                           |
| Expected tactics                       | Planning validation only: schema presence checks, generated table output, active-front order check.                                                                                                                        |
| Expected mathlib imports               | None;<br>no Lean code in this phase.                                                                                                                                                                                       |
| ExecComplex/computable plan            | None;<br>governance only.                                                                                                                                                                                                  |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                        |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                    |
| Expected executable witness            | not specified yet                                                                                                                                                                                                          |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                       |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                  |
| Bridge gap status                      | Closed for planning: global list exists and is inherited. Future code phases still need actual code audits.                                                                                                                |
| Natural backjump/refactor layer        | If a future phase violates a global no-go, backjump to its natural source layer or mirror isolation, not to consumer patching.                                                                                             |
| Implementation prompt contract         | Every future implementation prompt must cite global_no_go_guardrails and then state only additional phase-local no-go constraints.                                                                                         |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                |
| How implemented                        | Added top-level global_no_go_guardrails, workflow inheritance rule, LEG13, phase 1.1.1.1.0, proof dossier, generated table, and global_no_go_inheritance field across scratchpad records.                                  |
| Verification / evidence                | Planning generator validates global_no_go_guardrails and scratchpad inheritance. PDF/TSV generated from YAML. No Lean build was run or claimed.                                                                            |
| Proof strategy                         | Treat the guardrail list as a global invariant and make local scratchpad no-go lists inherit it explicitly.                                                                                                                |
| Build result                           | No Lean build. Planning table generation and PDF compilation only.                                                                                                                                                         |
| Post-implementation plan check         | Active cursor remains 1.1.1.1.1;<br>no white predecessor stands before it because 1.1.1.1.0 is green planning infrastructure.                                                                                              |
| Artifact packaging rule                | Return complete v26 zip, compiled PDF, and concise report. State that no Lean build was executed.                                                                                                                          |
| Implementation notes                   | This is a planning/workflow infrastructure close, not a Lean refactor. It prevents future phase-local no-go fields from replacing the global operational constraints.                                                      |

### Phase 1.1.1.1.0.1 – Concrete computable instance traversal and mathlib-complication scratchpad contract

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                    |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Phase type                            | infrastructure                                                                                                                                                                                                                                                            |
| Phase-type-specific contract          | Infrastructure/planning phase: justify absence of operational witness; close schema/decision prerequisites before code.                                                                                                                                                   |
| Title / state                         | Concrete computable instance traversal and mathlib-complication scratchpad contract                                                                                                                                                                                       |
| Preparation workflow                  | Infrastructure gate inserted after global no-go inheritance and before active module-manifest implementation.                                                                                                                                                             |
| Source-to-CNNA mapping                | LEG14 and LEG15 are workflow/control objects. They do not add CNNA mathematics; they force future operational phases to expose executable instance traversal and mathlib computability risks before code edits.                                                           |
| Dependency-depth audit                | Depends only on closed 1.1.1.1.0 global no-go inheritance. It must be green before active phase 1.1.1.1.1 because module manifests must know whether planned code is infrastructure-only or operational/executable.                                                       |
| Phase split decision                  | New small predecessor gate added. Do not split further unless a separate generated static-audit table is later introduced.                                                                                                                                                |
| Positive path plan                    | Keep positive construction first, but require instance pressure: generated substrate/window -> operational declarations -> concrete endpoint witness. If the path cannot be traversed, record the earliest natural missing source layer instead of patching the consumer. |
| Module implementation manifest        | No code modules introduced by this gate.                                                                                                                                                                                                                                  |
| Semantic placement decision           | Governance belongs in YAML master and generated views unless a future code-level policy module is justified.                                                                                                                                                              |
| Reuse and duplication audit           | No duplicate implementation authorized; decision reduces future duplication risk.                                                                                                                                                                                         |
| Canonical generator policy            | Generator-like logic must consume the canonical smoke/theory generator path; no parallel implementation.                                                                                                                                                                  |
| Module compactness rule               | Do not split code solely for this planning decision; use YAML/workflow unless a reusable code-level policy module is later justified.                                                                                                                                     |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                         |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                               |

|                                        |                                                                                                                                                                                                                                                                                         |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                              |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                        |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                           |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                     |
| Proof rehearsal before implementation  | For a future implementation: choose concrete finite instance; compute through the intended operational path; compare endpoint shape to proof target; if mathlib blocks executability, isolate mirror use or backjump.                                                                   |
| Expected tactics                       | No Lean tactics now. Future phases should prefer constructor/projection proofs and explicit finite-instance lemmas over fragile rewrite chains.                                                                                                                                         |
| Expected mathlib imports               | None for this planning gate. Future phases must record concrete mathlib import candidates and computability status.                                                                                                                                                                     |
| ExecComplex/computable plan            | No ExecComplex object introduced. Future ExecComplex phases must include a concrete finite instance traversal through the ExecComplex boundary/mirror seam.                                                                                                                             |
| Concrete computable instance traversal | Infrastructure-only gate: no operational Lean object introduced. The generated requirement is itself the traversal contract for future operational phases.                                                                                                                              |
| Computable path non-skeleton status    | closed for planning infrastructure; future operational phases must state concrete instance traversal before code edits                                                                                                                                                                  |
| Expected executable witness            | Required future field; for this gate the witness is generated scratchpad visibility, not a Lean executable term.                                                                                                                                                                        |
| Mathlib complication log               | Planning gate only. Records known risk class: mathlib algebraic interfaces may force noncomputable/classical dependencies; future phases must log concrete module/API names.                                                                                                            |
| Noncomputable boundary audit           | No Lean code changed. Future operational phases must separate operational code from mirror/non-operational noncomputable uses.                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib forces noncomputability in operational route, isolate in mirror layer or derive/implement an operational replacement at the natural source layer.                                                                                                                            |
| Bridge gap status                      | Closed as planning infrastructure. Mathematical bridges remain phase-specific.                                                                                                                                                                                                          |
| Natural backjump/refactor layer        | If concrete traversal fails because an earlier generated datum is missing, backjump to the earliest natural generator/source layer. If mathlib only provides noncomputable APIs, route them to mirror/non-operational layer or build an operational replacement.                        |
| Implementation prompt contract         | Before any Lean code edit, report whether the phase is infrastructure-only or operational. If operational, provide <code>concrete_instance_traversal</code> and <code>expected_executable_witness</code> , plus <code>mathlib_complication_log/noncomputable_boundary_audit</code> .    |
| Global no-go inheritance               | yes; all <code>global_no_go_guardrails</code> inherited (GNG01-GNG24)                                                                                                                                                                                                                   |
| How implemented                        | Planning infrastructure added to the YAML master and generator: every scratchpad record now contains concrete-instance traversal and mathlib/noncomputable complication fields. No Lean code moved.                                                                                     |
| Verification / evidence                | <code>generate_tables.py</code> validates the new required fields and renders them in <code>implementation_scratchpad.tex</code> ; artifact generation only, no Lean build.                                                                                                             |
| Proof strategy                         | No Lean proof. Infrastructure proof is that the generator requires and renders the fields for every phase record.                                                                                                                                                                       |
| Build result                           | No Lean build run; generated planning artifacts only.                                                                                                                                                                                                                                   |
| Post-implementation plan check         | After this gate, active phase 1.1.1.1.1 inherits the fields and must keep them visible in the scratchpad.                                                                                                                                                                               |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts. Lean build success may be recorded only from actual/current build or user-reported local build; otherwise local Lean build is required.                                                                 |
| Implementation notes                   | This closes the workflow-contract gap: operational computable code must be exercised by concrete instances and mathlib barriers must be logged before implementation.                                                                                                                   |
| Source materials / references          | <ul style="list-style-type: none"> <li>prior SM/AR implementation history</li> <li><code>global_no_go_guardrails</code></li> <li><code>implementation_scratchpad</code> records</li> <li>mathlib computability complication examples from earlier polynomial/matrix attempts</li> </ul> |

|                                      |                                                                                                                                                                                                                                                                                                                                                                    |

### Phase 1.1.1.1.0.2 – ExecComplex rational-boundary and mirror-only algebraic irrationality contract (EXEC-2)

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Phase type                            | infrastructure                                                                                                                                                                                                                                                                                             |
| Phase-type-specific contract          | Infrastructure/planning phase: justify absence of operational witness; close schema/decision prerequisites before code.                                                                                                                                                                                    |
| Title / state                         | EXEC-2 rational-boundary and mirror-only algebraic irrationality contract                                                                                                                                                                                                                                  |
| Preparation workflow                  | Architecture decision recorded before active implementation gate.                                                                                                                                                                                                                                          |
| Source-to-CNNA mapping                | Decision mapped to LEG object and workflow/format-decision rows; no ontic CNNA input introduced.                                                                                                                                                                                                           |
| Dependency-depth audit                | Depends on previous green architecture gate before active phase 1.1.1.1.1; closes a review-identified decision gap without changing Lean code.                                                                                                                                                             |
| Phase split decision                  | Inserted as green pre-active infrastructure gate under 1.1.1.1.0.x so no white predecessor remains before the active cursor.                                                                                                                                                                               |
| Positive path plan                    | Keep operational arithmetic through Q x Q ExecComplex for concrete rational/integer invariants. Put sqrt(D), general tau, algebraic eigenvalues, general lattice vectors and analytic modular data in mirror/non-operational layers. Permit return only for explicitly proved rational/integer invariants. |
| Module implementation manifest        | No code modules introduced by this gate.                                                                                                                                                                                                                                                                   |

|                                        |                                                                                                                                                                                                                               |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Semantic placement decision            | Governance belongs in YAML master and future optional architecture policy modules only if code-level records become useful.                                                                                                   |
| Reuse and duplication audit            | No duplicate implementation authorized;<br>decision reduces future duplication risk.                                                                                                                                          |
| Canonical generator policy             | Generator-like logic must consume the canonical smoke/theory generator path;<br>no parallel implementation.                                                                                                                   |
| Module compactness rule                | Do not split code solely for this planning decision;<br>encode as workflow/format decision unless a reusable code-level policy module is later justified.                                                                     |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                             |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                   |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Closed: operational paths end at $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrationalities are mirror-only;<br>proved rational/integer invariants may return operationally.                                               |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                 |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation  | Check each affected object: is the proposed value representable in $\mathbb{Q} \times \mathbb{Q}$ ? If no, mark mirror-only;<br>if a rational/integer invariant is needed, state its proof target and source objects.         |
| Expected tactics                       | None;<br>no Lean proof in this planning gate.                                                                                                                                                                                 |
| Expected mathlib imports               | None for planning gate.                                                                                                                                                                                                       |
| ExecComplex/computable plan            | EXEC-2 closed at planning level: $\mathbb{Q} \times \mathbb{Q}$ is not extended now;<br>algebraic extensions are not silently introduced.                                                                                     |
| Concrete computable instance traversal | Infrastructure-only gate: no operational Lean object introduced. Later operational phases must provide concrete finite instance traversal.                                                                                    |
| Computable path non-skeleton status    | infrastructure-only;<br>this gate adds obligations that prevent later operational skeletons.                                                                                                                                  |
| Expected executable witness            | None for planning gate.                                                                                                                                                                                                       |
| Mathlib complication log               | No direct mathlib import in this planning gate. Future phases must log complications.                                                                                                                                         |
| Noncomputable boundary audit           | No direct Lean boundary touched;<br>future phases must audit noncomputable/classical pressure.                                                                                                                                |
| Mathlib mitigation/refactor layer      | If future mathlib pressure appears, isolate in mirror/non-operational layer or backjump to earliest natural source layer.                                                                                                     |
| Bridge gap status                      | Closed as planning decision;<br>implementation bridges remain future phase obligations.                                                                                                                                       |
| Natural backjump/refactor layer        | If implementation later violates this decision, backjump to the earliest natural layer recorded by the relevant workflow.                                                                                                     |
| Implementation prompt contract         | Future implementation prompts must cite this gate when relevant.                                                                                                                                                              |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                   |
| How implemented                        | Planning/architecture gate closed in YAML master;<br>no Lean source changed.                                                                                                                                                  |
| Verification / evidence                | Generated tables/PDF render the gate. No Lean build was run or claimed.                                                                                                                                                       |
| Proof strategy                         | Schema-level planning proof, not Lean theorem.                                                                                                                                                                                |
| Build result                           | No Lean build run;<br>planning artifact generated only.                                                                                                                                                                       |
| Post-implementation plan check         | Satisfied at planning level;<br>active cursor remains 1.1.1.1.1.                                                                                                                                                              |
| Artifact packaging rule                | Return complete zip/PDF/report for planning updates. Lean build success may be recorded only from an actual current/user-reported build.                                                                                      |
| Implementation notes                   | This is a pre-implementation decision gate;<br>it constrains later code phases without modifying code itself.                                                                                                                 |

|                                      |                                                                                                                                                                      |

### Phase 1.1.1.1.0.3 – Refactor regression protocol and incremental migration policy

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
 Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                            |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                                                                                                 |
| Context class                         | LeanGovernancePhase                                                                                                                                                                                                               |
| Phase documentation tier              | F1                                                                                                                                                                                                                                |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                                    |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                               |

| Preparation status                    | completed                                                                                                                                                                                                                         |
| Phase type                            | infrastructure                                                                                                                                                                                                                    |
| Phase-type-specific contract          | Infrastructure/planning phase: justify absence of operational witness; close schema/decision prerequisites before code.                                                                                                           |
| Title / state                         | Refactor regression protocol and incremental migration policy                                                                                                                                                                     |
| Preparation workflow                  | Architecture decision recorded before active implementation gate.                                                                                                                                                                 |
| Source-to-CNNA mapping                | Decision mapped to LEG object and workflow/format-decision rows; no ontic CNNA input introduced.                                                                                                                                  |
| Dependency-depth audit                | Depends on previous green architecture gate before active phase 1.1.1.1.1; closes a review-identified decision gap without changing Lean code.                                                                                    |
| Phase split decision                  | Inserted as green pre-active infrastructure gate under 1.1.1.1.0.x so no white predecessor remains before the active cursor.                                                                                                      |
| Positive path plan                    | Use wrapper-first migration for Notation/Legacy cleanup: introduce neutral wrappers, migrate consumers in bounded batches, keep compatibility shims until consumers are moved, and require local full-build evidence per package. |
| Module implementation manifest        | No code modules introduced by this gate.                                                                                                                                                                                          |
| Semantic placement decision           | Governance belongs in YAML master and future optional architecture policy modules only if code-level records become useful.                                                                                                       |
| Reuse and duplication audit           | No duplicate implementation authorized; decision reduces future duplication risk.                                                                                                                                                 |
| Canonical generator policy            | Generator-like logic must consume the canonical smoke/theory generator path; no parallel implementation.                                                                                                                          |
| Module compactness rule               | Do not split code solely for this planning decision; encode as workflow/format decision unless a reusable code-level policy module is later justified.                                                                            |
| Refactor regression protocol          | Closed: no refactor phase may close without declaration-count/import-delta/consumer-breakage audit and local full-build evidence.                                                                                                 |

|                                        |                                                                                                                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refactor migration metrics             | Template required: declarations_migrated_count;<br>modules_added;<br>modules_modified;<br>imports_changed;<br>import_graph_delta;<br>consumer_breakage_audit;<br>compatibility_aliases_kept;<br>build_evidence_source.     |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                           |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation  | For each migration batch: list declarations moved, imports changed, consumers touched, compatibility aliases kept, and expected local build command/evidence.                                                              |
| Expected tactics                       | None;<br>no Lean proof in this planning gate.                                                                                                                                                                              |
| Expected mathlib imports               | None for planning gate.                                                                                                                                                                                                    |
| ExecComplex/computable plan            | None for this planning/infrastructure gate unless explicitly stated.                                                                                                                                                       |
| Concrete computable instance traversal | Infrastructure-only gate: no operational Lean object introduced. Later operational phases must provide concrete finite instance traversal.                                                                                 |
| Computable path non-skeleton status    | infrastructure-only;<br>this gate adds obligations that prevent later operational skeletons.                                                                                                                               |
| Expected executable witness            | None for planning gate.                                                                                                                                                                                                    |
| Mathlib complication log               | No direct mathlib import in this planning gate. Future phases must log complications.                                                                                                                                      |
| Noncomputable boundary audit           | No direct Lean boundary touched;<br>future phases must audit noncomputable/classical pressure.                                                                                                                             |
| Mathlib mitigation/refactor layer      | If future mathlib pressure appears, isolate in mirror/non-operational layer or backjump to earliest natural source layer.                                                                                                  |
| Bridge gap status                      | Closed as planning decision;<br>implementation bridges remain future phase obligations.                                                                                                                                    |
| Natural backjump/refactor layer        | If implementation later violates this decision, backjump to the earliest natural layer recorded by the relevant workflow.                                                                                                  |
| Implementation prompt contract         | Future implementation prompts must cite this gate when relevant.                                                                                                                                                           |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                |
| How implemented                        | Planning/architecture gate closed in YAML master;<br>no Lean source changed.                                                                                                                                               |
| Verification / evidence                | Generated tables/PDF render the gate. No Lean build was run or claimed.                                                                                                                                                    |
| Proof strategy                         | Schema-level planning proof, not Lean theorem.                                                                                                                                                                             |
| Build result                           | No Lean build run;<br>planning artifact generated only.                                                                                                                                                                    |
| Post-implementation plan check         | Satisfied at planning level;<br>active cursor remains 1.1.1.1.1.                                                                                                                                                           |
| Artifact packaging rule                | Return complete zip/PDF/report for planning updates. Lean build success may be recorded only from an actual current/user-reported build.                                                                                   |
| Implementation notes                   | This is a pre-implementation decision gate;<br>it constrains later code phases without modifying code itself.                                                                                                              |

Phase 1.1.1.1.0.4 – Lean/mathlib version baseline and upgrade-gate policy

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                            |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                                                                 |
| Context class                         | LeanGovernancePhase                                                                                                                                                                               |
| Phase documentation tier              | F1                                                                                                                                                                                                |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.    |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                               |
| Implementation status                 | completed                                                                                                                                                                                         |
| Preparation status                    | completed                                                                                                                                                                                         |
| Phase type                            | infrastructure                                                                                                                                                                                    |
| Phase-type-specific contract          | Infrastructure/planning phase: justify absence of operational witness;<br>close schema/decision prerequisites before code.                                                                        |
| Title / state                         | Lean/mathlib version baseline and upgrade-gate policy                                                                                                                                             |
| Preparation workflow                  | Architecture decision recorded before active implementation gate.                                                                                                                                 |
| Source-to-CNNA mapping                | Decision mapped to LEG object and workflow/format-decision rows;<br>no ontic CNNA input introduced.                                                                                               |
| Dependency-depth audit                | Depends on previous green architecture gate before active phase 1.1.1.1.1;<br>closes a review-identified decision gap without changing Lean code.                                                 |
| Phase split decision                  | Inserted as green pre-active infrastructure gate under 1.1.1.1.0.x so no white predecessor remains before the active cursor.                                                                      |
| Positive path plan                    | Use the frozen Lean 4.28.0/mathlib baseline for implementation. If a phase needs newer API, open a separate phase-boundary upgrade gate instead of silently changing imports.                     |
| Module implementation manifest        | No code modules introduced by this gate.                                                                                                                                                          |
| Semantic placement decision           | Governance belongs in YAML master and future optional architecture policy modules only if code-level records become useful.                                                                       |
| Reuse and duplication audit           | No duplicate implementation authorized;<br>decision reduces future duplication risk.                                                                                                              |
| Canonical generator policy            | Generator-like logic must consume the canonical smoke/theory generator path;<br>no parallel implementation.                                                                                       |
| Module compactness rule               | Do not split code solely for this planning decision;<br>encode as workflow/format decision unless a reusable code-level policy module is later justified.                                         |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout. |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.       |
| Lean/mathlib version policy           | Closed: baseline freeze by default;<br>upgrades only at explicit phase-boundary gates with separate build/review evidence.                                                                        |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                       |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                     |
| Governance-overhead review            | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                            |

|                                        |                                                                                                                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof rehearsal before implementation  | Before adding a mathlib import: verify baseline availability, record computability/noncomputable pressure, and decide operational vs mirror placement.               |
| Expected tactics                       | None;<br>no Lean proof in this planning gate.                                                                                                                        |
| Expected mathlib imports               | None for planning gate.                                                                                                                                              |
| ExecComplex/computable plan            | None for this planning/infrastructure gate unless explicitly stated.                                                                                                 |
| Concrete computable instance traversal | Infrastructure-only gate: no operational Lean object introduced. Later operational phases must provide concrete finite instance traversal.                           |
| Computable path non-skeleton status    | infrastructure-only;<br>this gate adds obligations that prevent later operational skeletons.                                                                         |
| Expected executable witness            | None for planning gate.                                                                                                                                              |
| Mathlib complication log               | No direct mathlib import in this planning gate. Future phases must log complications.                                                                                |
| Noncomputable boundary audit           | No direct Lean boundary touched;<br>future phases must audit noncomputable/classical pressure.                                                                       |
| Mathlib mitigation/refactor layer      | If future mathlib pressure appears, isolate in mirror/non-operational layer or backjump to earliest natural source layer.                                            |
| Bridge gap status                      | Closed as planning decision;<br>implementation bridges remain future phase obligations.                                                                              |
| Natural backjump/refactor layer        | If implementation later violates this decision, backjump to the earliest natural layer recorded by the relevant workflow.                                            |
| Implementation prompt contract         | Future implementation prompts must cite this gate when relevant.                                                                                                     |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                          |
| How implemented                        | Planning/architecture gate closed in YAML master;<br>no Lean source changed.                                                                                         |
| Verification / evidence                | Generated tables/PDF render the gate. No Lean build was run or claimed.                                                                                              |
| Proof strategy                         | Schema-level planning proof, not Lean theorem.                                                                                                                       |
| Build result                           | No Lean build run;<br>planning artifact generated only.                                                                                                              |
| Post-implementation plan check         | Satisfied at planning level;<br>active cursor remains 1.1.1.1.1.                                                                                                     |
| Artifact packaging rule                | Return complete zip/PDF/report for planning updates. Lean build success may be recorded only from an actual current/user-reported build.                             |
| Implementation notes                   | This is a pre-implementation decision gate;<br>it constrains later code phases without modifying code itself.                                                        |
| Source materials / references          | <ul style="list-style-type: none"> <li>v28 code/theory/review validation</li> <li>current YAML master</li> <li>static repo inventory and previous reports</li> </ul> |
| Extracted established theory objects   | <ul style="list-style-type: none"> <li>architecture decision gate</li> <li>workflow policy</li> <li>proof-dossier object</li> </ul>                                  |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>inherits global no-go guardrails;<br/>no local weakening allowed</li> </ul>                                                   |

### Phase 1.1.1.1.0.5 – Phase-type-specific scratchpad schema and governance-depth review gate

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field         | Record                                            |
|---------------|---------------------------------------------------|
| Phase status  | <span style="background-color: #d9ead3;">G</span> |
| Context class | LeanGovernancePhase                               |

|                                        |                                                                                                                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase documentation tier               | F3                                                                                                                                                                                                                         |
| Phase documentation depth requirement  | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                                  |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                         |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                        |
| Implementation status                  | completed                                                                                                                                                                                                                  |
| Preparation status                     | completed                                                                                                                                                                                                                  |
| Phase type                             | infrastructure                                                                                                                                                                                                             |
| Phase-type-specific contract           | Infrastructure/planning phase: justify absence of operational witness; close schema/decision prerequisites before code.                                                                                                    |
| Title / state                          | Phase-type-specific scratchpad schema and governance-depth review gate                                                                                                                                                     |
| Preparation workflow                   | Architecture decision recorded before active implementation gate.                                                                                                                                                          |
| Source-to-CNNA mapping                 | Decision mapped to LEG object and workflow/format-decision rows; no ontic CNNA input introduced.                                                                                                                           |
| Dependency-depth audit                 | Depends on previous green architecture gate before active phase 1.1.1.1.1; closes a review-identified decision gap without changing Lean code.                                                                             |
| Phase split decision                   | Inserted as green pre-active infrastructure gate under 1.1.1.1.0.x so no white predecessor remains before the active cursor.                                                                                               |
| Positive path plan                     | Record phase_type for every phase and render type-specific fields. Use different required evidence for refactor, derivation, infrastructure, documentation and comparison phases.                                          |
| Module implementation manifest         | No code modules introduced by this gate.                                                                                                                                                                                   |
| Semantic placement decision            | Governance belongs in YAML master and future optional architecture policy modules only if code-level records become useful.                                                                                                |
| Reuse and duplication audit            | No duplicate implementation authorized; decision reduces future duplication risk.                                                                                                                                          |
| Canonical generator policy             | Generator-like logic must consume the canonical smoke/theory generator path; no parallel implementation.                                                                                                                   |
| Module compactness rule                | Do not split code solely for this planning decision; encode as workflow/format decision unless a reusable code-level policy module is later justified.                                                                     |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                           |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review             | Closed as future-retrospective requirement: after Phase 1.1.2, record which governance gates prevented actual errors and decide whether Phase 3+ can flatten structure.                                                    |
| Proof rehearsal before implementation  | Inspect a refactor phase and a derivation phase: the refactor must not fake proof rehearsal; the derivation must not omit proof/tactic/mathlib evidence.                                                                   |
| Expected tactics                       | None; no Lean proof in this planning gate.                                                                                                                                                                                 |
| Expected mathlib imports               | None for planning gate.                                                                                                                                                                                                    |
| ExecComplex/computable plan            | None for this planning/infrastructure gate unless explicitly stated.                                                                                                                                                       |
| Concrete computable instance traversal | Infrastructure-only gate: no operational Lean object introduced. Later operational phases must provide concrete finite instance traversal.                                                                                 |
| Computable path non-skeleton status    | infrastructure-only; this gate adds obligations that prevent later operational skeletons.                                                                                                                                  |
| Expected executable witness            | None for planning gate.                                                                                                                                                                                                    |
| Mathlib complication log               | No direct mathlib import in this planning gate. Future phases must log complications.                                                                                                                                      |
| Noncomputable boundary audit           | No direct Lean boundary touched; future phases must audit noncomputable/classical pressure.                                                                                                                                |
| Mathlib mitigation/refactor layer      | If future mathlib pressure appears, isolate in mirror/non-operational layer or backjump to earliest natural source layer.                                                                                                  |

|                                      |                                                                                                                                                                      |
|--------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Bridge gap status                    | Closed as planning decision;<br>implementation bridges remain future phase obligations.                                                                              |
| Natural backjump/refactor layer      | If implementation later violates this decision, backjump to the earliest natural layer recorded by the relevant workflow.                                            |
| Implementation prompt contract       | Future implementation prompts must cite this gate when relevant.                                                                                                     |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                          |
| How implemented                      | Planning/architecture gate closed in YAML master;<br>no Lean source changed.                                                                                         |
| Verification / evidence              | Generated tables/PDF render the gate. No Lean build was run or claimed.                                                                                              |
| Proof strategy                       | Schema-level planning proof, not Lean theorem.                                                                                                                       |
| Build result                         | No Lean build run;<br>planning artifact generated only.                                                                                                              |
| Post-implementation plan check       | Satisfied at planning level;<br>active cursor remains 1.1.1.1.1.                                                                                                     |
| Artifact packaging rule              | Return complete zip/PDF/report for planning updates. Lean build success may be recorded only from an actual current/user-reported build.                             |
| Implementation notes                 | This is a pre-implementation decision gate;<br>it constrains later code phases without modifying code itself.                                                        |
| Source materials / references        | <ul style="list-style-type: none"> <li>v28 code/theory/review validation</li> <li>current YAML master</li> <li>static repo inventory and previous reports</li> </ul> |

### Phase 1.1.1.1.0.6 – Phase 3 to Phase 4 consumer-contract direction lock

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                                                              |
| Context class                         | LeanGovernancePhase                                                                                                                                                                            |
| Phase documentation tier              | F1                                                                                                                                                                                             |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                             |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                            |
| Implementation status                 | completed                                                                                                                                                                                      |
| Preparation status                    | completed                                                                                                                                                                                      |

| Phase-type-specific contract          | Infrastructure/planning phase: justify absence of operational witness;<br>close schema/decision prerequisites before code.                                                                     |
| Title / state                         | Phase 3 to Phase 4 consumer-contract direction lock                                                                                                                                            |
| Preparation workflow                  | Architecture decision recorded before active implementation gate.                                                                                                                              |
| Source-to-CNNA mapping                | Decision mapped to LEG object and workflow/format-decision rows;<br>no ontic CNNA input introduced.                                                                                            |

|                                        |                                                                                                                                                                                                                               |
|----------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependency-depth audit                 | Depends on previous green architecture gate before active phase 1.1.1.1.1;<br>closes a review-identified decision gap without changing Lean code.                                                                             |
| Phase split decision                   | Inserted as green pre-active infrastructure gate under 1.1.1.1.0.x so no white predecessor remains before the active cursor.                                                                                                  |
| Positive path plan                     | Make Phase 3.6 publish a BoundaryOperatorProfile shaped for Phase 4.1. Keep import direction one-way: Phase 4 consumes Phase 3;<br>Phase 3 never imports Phase 4.                                                             |
| Module implementation manifest         | No code modules introduced by this gate.                                                                                                                                                                                      |
| Semantic placement decision            | Governance belongs in YAML master and future optional architecture policy modules only if code-level records become useful.                                                                                                   |
| Reuse and duplication audit            | No duplicate implementation authorized;<br>decision reduces future duplication risk.                                                                                                                                          |
| Canonical generator policy             | Generator-like logic must consume the canonical smoke/theory generator path;<br>no parallel implementation.                                                                                                                   |
| Module compactness rule                | Do not split code solely for this planning decision;<br>encode as workflow/format decision unless a reusable code-level policy module is later justified.                                                                     |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                             |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                   |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                           |
| Consumer-contract direction            | Closed: Phase 3.6 exports consumer-ready profile;<br>Phase 4.1 consumes;<br>no reverse import and no duplicate generator/Schur implementation.                                                                                |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation  | At Phase 3.6 preparation, write the exact fields Phase 4.1 needs. At Phase 4.1 preparation, show it consumes those fields and does not reconstruct Schur/DtN internals.                                                       |
| Expected tactics                       | None;<br>no Lean proof in this planning gate.                                                                                                                                                                                 |
| Expected mathlib imports               | None for planning gate.                                                                                                                                                                                                       |
| ExecComplex/computable plan            | None for this planning/infrastructure gate unless explicitly stated.                                                                                                                                                          |
| Concrete computable instance traversal | Infrastructure-only gate: no operational Lean object introduced. Later operational phases must provide concrete finite instance traversal.                                                                                    |
| Computable path non-skeleton status    | infrastructure-only;<br>this gate adds obligations that prevent later operational skeletons.                                                                                                                                  |
| Expected executable witness            | None for planning gate.                                                                                                                                                                                                       |
| Mathlib complication log               | No direct mathlib import in this planning gate. Future phases must log complications.                                                                                                                                         |
| Noncomputable boundary audit           | No direct Lean boundary touched;<br>future phases must audit noncomputable/classical pressure.                                                                                                                                |
| Mathlib mitigation/refactor layer      | If future mathlib pressure appears, isolate in mirror/non-operational layer or backjump to earliest natural source layer.                                                                                                     |
| Bridge gap status                      | Closed as planning decision;<br>implementation bridges remain future phase obligations.                                                                                                                                       |
| Natural backjump/refactor layer        | If implementation later violates this decision, backjump to the earliest natural layer recorded by the relevant workflow.                                                                                                     |
| Implementation prompt contract         | Future implementation prompts must cite this gate when relevant.                                                                                                                                                              |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                   |
| How implemented                        | Planning/architecture gate closed in YAML master;<br>no Lean source changed.                                                                                                                                                  |
| Verification / evidence                | Generated tables/PDF render the gate. No Lean build was run or claimed.                                                                                                                                                       |
| Proof strategy                         | Schema-level planning proof, not Lean theorem.                                                                                                                                                                                |
| Build result                           | No Lean build run;<br>planning artifact generated only.                                                                                                                                                                       |

|                                      |                                                                                                                                                                  |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Post-implementation plan check       | Satisfied at planning level;<br>active cursor remains 1.1.1.1.1.                                                                                                 |
| Artifact packaging rule              | Return complete zip/PDF/report for planning updates. Lean build success may be recorded only from an actual current/user-reported build.                         |
| Implementation notes                 | This is a pre-implementation decision gate;<br>it constrains later code phases without modifying code itself.                                                    |

Phase 1.1.1.1.0.7 – IdealThread/CutSpec.full extremal-route contract and string-analogy boundary lock

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                              |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3; border: 1px solid #000; padding: 0 2px;">G</span>                                                                                                           |
| Context class                         | LeanGovernancePhase                                                                                                                                                                                 |
| Phase documentation tier              | F1                                                                                                                                                                                                  |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.      |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                  |

| Phase type                            | infrastructure                                                                                                                                                                                      |
| Phase-type-specific contract          | Infrastructure/planning phase: justify absence of operational witness;<br>close schema/decision prerequisites before code.                                                                          |
| Title / state                         | IdealThread/CutSpec.full extremal-route contract and string-analogy boundary lock                                                                                                                   |
| Preparation workflow                  | Architecture decision recorded before active implementation gate.                                                                                                                                   |
| Source-to-CNNA mapping                | Mapped verified code facts to a workflow/format-decision row, LEG proof dossier, and future neutral route phases;<br>no analogy supplies CNNA-generative data.                                      |
| Dependency-depth audit                | Depends on previous green architecture gates and closes an additional review-identified decision gap before active phase 1.1.1.1.1.                                                                 |
| Phase split decision                  | Inserted as green pre-active infrastructure gate under 1.1.1.1.0.x so no white predecessor remains before the active cursor.                                                                        |
| Positive path plan                    | Close the route decision before any module manifest: IdealThread is the singleton/thread route;<br>CutSpec.full is the full-carrier route;<br>the string-like reading is a downstream analogy only. |
| Module implementation manifest        | No code modules introduced by this gate;<br>future module candidates are S07/S08/BR06/BR07 phases.                                                                                                  |
| Semantic placement decision           | Place code-backed route facts in later neutral structural modules;<br>place string-like interpretation only in secondary/documentation side roads.                                                  |
| Reuse and duplication audit           | Reuse existing ToC.Contract, CutSpec.full, ExistingIdealThreadNoGo, FullBoundaryAudit, RecursiveSchurSource and MobiusTransfer;<br>no duplicate route implementation authorized.                    |
| Canonical generator policy            | Generator-like logic remains on the canonical smoke/theory generator path. IdealThread/string analogy may not instantiate a parallel generator.                                                     |

|                                        |                                                                                                                                                                                                                                      |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Module compactness rule                | Do not split code solely for this planning decision;<br>encode as workflow/format decision unless a reusable code-level policy module is later justified.                                                                            |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                    |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                          |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline;<br>noncomputable/classical pressure must be logged and isolated.        |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                |
| Consumer-contract direction            | Later phases consume route profiles one-way: S07/S08 feed BR06;<br>BR06 feeds Phase 3/4;<br>secondary analogy consumes dossiers only and never feeds A-generation.                                                                   |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                               |
| Proof rehearsal before implementation  | Code facts: IdealThread.carrier is a singleton;<br>IdealThread.family embeds it as DirectedFamily;<br>deterministic coarsen gives previous singleton;<br>CutSpec.full carrier is T.carrier. Therefore route conflation is forbidden. |
| Expected tactics                       | None;<br>no Lean proof in this planning gate.                                                                                                                                                                                        |
| Expected mathlib imports               | None for planning gate.                                                                                                                                                                                                              |
| ExecComplex/computable plan            | None for this planning/infrastructure gate unless explicitly stated.                                                                                                                                                                 |
| Concrete computable instance traversal | Infrastructure-only gate;<br>it requires later S07/S08/BR06/BR07 phases to show concrete finite reference/variation/full-cut instances before operational use.                                                                       |
| Computable path non-skeleton status    | infrastructure-only;<br>explicitly prevents later operational skeletons by requiring route-specific finite witnesses.                                                                                                                |
| Expected executable witness            | None for this planning gate;<br>later route phases must name the finite instance.                                                                                                                                                    |
| Mathlib complication log               | No new mathlib import in this planning gate.                                                                                                                                                                                         |
| Noncomputable boundary audit           | No Lean boundary touched;<br>later route phases must audit noncomputable/classical pressure if they import additional mathlib APIs.                                                                                                  |
| Mathlib mitigation/refactor layer      | If future mathlib pressure appears, isolate in mirror/non-operational layer or backjump to earliest natural source layer.                                                                                                            |
| Bridge gap status                      | Closed as planning decision;<br>implementation bridges remain future phase obligations.                                                                                                                                              |
| Natural backjump/refactor layer        | If implementation later violates this decision, backjump to the earliest natural layer recorded by the relevant workflow.                                                                                                            |
| Implementation prompt contract         | Future implementation prompts must cite this gate when relevant.                                                                                                                                                                     |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                          |
| How implemented                        | Planning/architecture gate closed in YAML master;<br>no Lean source changed.                                                                                                                                                         |
| Verification / evidence                | Existing Lean source was inspected for route facts;<br>generated tables/PDF render the gate. No Lean build was run or claimed.                                                                                                       |
| Proof strategy                         | Schema-level planning proof, not Lean theorem.                                                                                                                                                                                       |
| Build result                           | No Lean build run;<br>planning artifact generated only.                                                                                                                                                                              |
| Post-implementation plan check         | Satisfied at planning level;<br>active cursor remains 1.1.1.1.1.                                                                                                                                                                     |
| Artifact packaging rule                | Return complete zip/PDF/report for planning updates. Lean build success may be recorded only from an actual current/user-reported build.                                                                                             |
| Implementation notes                   | This is a pre-implementation route decision gate. It constrains later code phases without moving Lean declarations.                                                                                                                  |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                      |

### Phase 1.1.1.1.0.8 – Horizontal/vertical Schur-complement duality dependency-order lock

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                           |

| Preparation status                    | completed                                                                                                                                                                                                                                                        |
| Phase type                            | infrastructure                                                                                                                                                                                                                                                   |
| Phase-type-specific contract          | Infrastructure/planning phase: close bridge-order and no-input constraints before code; no operational witness required.                                                                                                                                         |
| Title / state                         | Horizontal/vertical Schur-complement duality dependency-order lock                                                                                                                                                                                               |
| Preparation workflow                  | Architecture decision recorded before active implementation gate.                                                                                                                                                                                                |
| Source-to-CNNA mapping                | Mapped verified code facts to a workflow/format-decision row, LEG proof dossier, and future neutral route phases; no analogy supplies CNNA-generative data.                                                                                                      |
| Dependency-depth audit                | The bridge requires S05, O05, TM0-TM2, CD7, BR06, BR07, S07 and S08. Since these are later or unclosed, only the order lock is green; the bridge itself is white/future.                                                                                         |
| Phase split decision                  | Inserted as green pre-active infrastructure gate 1.1.1.1.0.8; actual mathematics placed later as 10.4.1 and 10.4.2 so no white predecessor appears before the active cursor.                                                                                     |
| Positive path plan                    | Preserve the positive insight by registering BR08/BR09 and by moving CD8 final proof after BR08. Earlier phases export data; they do not consume the duality conclusion.                                                                                         |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                   |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy_coexistence</code> status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                       |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                               |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consumer-contract direction            | One-way only: earlier route phases export S05/O05/TM0/CD7/BR06/BR07 to BR08; BR08/CD8 may not backfeed into their definitions.                                                                                                                                                                                                                                                           |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                                                      |
| Proof rehearsal before implementation  | Planning proof: if a theorem depends on vertical transfermatrix data TM0 and horizontal boundary operator S05, it cannot be scheduled before those routes. Therefore the bridge is locked as a later consumer of both routes.                                                                                                                                                            |
| Expected tactics                       | None; no Lean proof in this planning gate.                                                                                                                                                                                                                                                                                                                                               |
| Expected mathlib imports               | None for planning gate.                                                                                                                                                                                                                                                                                                                                                                  |
| ExecComplex/computable plan            | None for this planning/infrastructure gate unless explicitly stated.                                                                                                                                                                                                                                                                                                                     |
| Concrete computable instance traversal | Infrastructure-only gate; it requires later S07/S08/BR06/BR07 phases to show concrete finite reference/variation/full-cut instances before operational use.                                                                                                                                                                                                                              |
| Computable path non-skeleton status    | infrastructure-only; explicitly prevents later operational skeletons by requiring route-specific finite witnesses.                                                                                                                                                                                                                                                                       |
| Expected executable witness            | None for this planning gate; later route phases must name the finite instance.                                                                                                                                                                                                                                                                                                           |
| Mathlib complication log               | No new mathlib import in this planning gate.                                                                                                                                                                                                                                                                                                                                             |
| Noncomputable boundary audit           | No Lean boundary touched; later route phases must audit noncomputable/classical pressure if they import additional mathlib APIs.                                                                                                                                                                                                                                                         |
| Mathlib mitigation/refactor layer      | If future mathlib pressure appears, isolate in mirror/non-operational layer or backjump to earliest natural source layer.                                                                                                                                                                                                                                                                |
| Bridge gap status                      | Closed as an order/governance decision; mathematical bridge remains BR08 future target.                                                                                                                                                                                                                                                                                                  |
| Natural backjump/refactor layer        | If implementation later violates this decision, backjump to the earliest natural layer recorded by the relevant workflow.                                                                                                                                                                                                                                                                |
| Implementation prompt contract         | Future implementation prompts must cite this gate when relevant.                                                                                                                                                                                                                                                                                                                         |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                                                 |
| How implemented                        | Planning/architecture gate closed in YAML master; no Lean source changed.                                                                                                                                                                                                                                                                                                                |
| Verification / evidence                | Planning master updated and generated views validate the dependency-order lock. No Lean build was run or claimed.                                                                                                                                                                                                                                                                        |
| Build result                           | No Lean build required for planning gate; PDF/table generation only.                                                                                                                                                                                                                                                                                                                     |
| Post-implementation plan check         | Satisfied at planning level; active cursor remains 1.1.1.1.1.                                                                                                                                                                                                                                                                                                                            |
| Artifact packaging rule                | Return complete zip/PDF/report for planning updates. Lean build success may be recorded only from an actual current/user-reported build.                                                                                                                                                                                                                                                 |
| Implementation notes                   | This planning gate accepts the Schur-unification insight only as a dependency-ordered future theorem target. It adds no Lean definitions.                                                                                                                                                                                                                                                |
| No-go guardrails                       | <ul style="list-style-type: none"> <li>GLOBAL-INHERITED: top-level global_no_go_guardrails apply; this phase adds no weakening.</li> <li>do not use horizontal/vertical Schur-duality as an input to Phase 1.4, 3, 4, 5, or 6</li> <li>do not close CD8 before BR08</li> <li>do not convert subsystem/string analogy into a theorem without checked Schur decomposition proof</li> </ul> |

### Phase 1.1.1.1.0.9 – Heuristic Eisenstein/Gauss lattice test-matrix boundary and ordering lock

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                    | Record                                                                                    |

| Context class            | LeanGovernancePhase                                                                       |
| Phase documentation tier | F1                                                                                        |

|                                        |                                                                                                                                                                                                                                                                        |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase documentation depth requirement  | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                                                                         |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                                                                     |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                    |
| Implementation status                  | completed                                                                                                                                                                                                                                                              |
| Preparation status                     | completed                                                                                                                                                                                                                                                              |
| Phase type                             | infrastructure                                                                                                                                                                                                                                                         |
| Phase-type-specific contract           | infrastructure decision                                                                                                                                                                                                                                                |
| Title / state                          | Heuristic Eisenstein/Gauss lattice test-matrix boundary and ordering lock                                                                                                                                                                                              |
| Preparation workflow                   | Infrastructure / planning gate.                                                                                                                                                                                                                                        |
| Source-to-CNNA mapping                 | post #97 maps to a future consumer-only test matrix: L09/L10/M08/BR10. It does not define b, the generator, tau, or j.                                                                                                                                                 |
| Dependency-depth audit                 | The test matrix must come after generator/branching, EXEC-2, lattice angle/cosine, tau/CM and j target phases. Therefore it is registered now as a decision lock and implemented later as 8.5-8.7.                                                                     |
| Phase split decision                   | Split into green planning lock 1.1.1.1.0.9 plus future phases 8.5 static test matrix, 8.6 dynamic branch sweep, and 8.7 closeout/public-boundary audit.                                                                                                                |
| Positive path plan                     | Use the positive path: construct explicit test records and only then compare against special cases;<br>do not start by obstruction.                                                                                                                                    |
| Refactor regression protocol           | No refactor performed in this phase;<br>future code tests must keep the full local build green after each wrapper/test addition.                                                                                                                                       |
| Refactor migration metrics             | Not applicable until implementation.                                                                                                                                                                                                                                   |
| Lean/mathlib version policy            | Lean/mathlib baseline remains 4.28.0 unless an explicit upgrade gate is opened.                                                                                                                                                                                        |
| ExecComplex boundary policy            | EXEC-2 applies: QxQ operational boundary;<br>irrational geometry and j analytic values are mirror/comparison targets only.                                                                                                                                             |
| Consumer-contract direction            | Tests consume generator/geometry/CM outputs;<br>they do not define those outputs.                                                                                                                                                                                      |
| Governance-overhead review             | This gate prevents a likely false implementation path: injecting angle heuristics into the generator rather than testing them as comparison targets.                                                                                                                   |
| Proof rehearsal before implementation  | For future finite tests: build rows from code-defined b and L_max;<br>compute address counts/relations and rational cos/Gram/D surrogates;<br>compare mirror-only tau/j targets after their source objects exist.                                                      |
| Expected tactics                       | Finite structural constructors, explicit Fin/Nat/address enumeration, relation witness construction, projection lemmas;<br>no analytic complex simplification in operational path.                                                                                     |
| Expected mathlib imports               | Use existing project imports first;<br>future CM/j mirror tests may require mathlib modular/complex APIs only in non-operational layers after import existence is checked.                                                                                             |
| ExecComplex/computable plan            | Operational path may record only rational/integer outputs: branching code value, finite addresses, collision relations, cos(theta), integer/rational Gram invariants, D target. Complex coordinates, tau, sqrt(D), and analytic j evaluation remain mirror/comparison. |
| Concrete computable instance traversal | Required for future implementation: at least b=2 with L_max=3 and 4, plus one code-defined dynamic-branching case if available;<br>b=0/1 as degenerate controls only if the code exposes them legally.                                                                 |
| Computable path non-skeleton status    | Future test implementation must actually traverse finite addresses and compute expected finite invariants, not merely instantiate empty profile records.                                                                                                               |
| Expected executable witness            | Future witness: finite test matrix rows for Eisenstein and Gauss cases over selected L_max values, using the canonical generator/branching API.                                                                                                                        |
| Mathlib complication log               | Likely complication: analytic j/tau/sqrt(D) APIs may be noncomputable;<br>keep those in mirror/comparison layer and record any import/noncomputable boundary explicitly.                                                                                               |
| Noncomputable boundary audit           | Operational tests must avoid noncomputable analytic complex evaluation. Mirror tests may state comparison targets but must not feed operational definitions.                                                                                                           |
| Mathlib mitigation/refactor layer      | Use rational/integer surrogates in operational layer;<br>isolate analytic or algebraic-irrational material in mirror/profile modules.                                                                                                                                  |
| Bridge gap status                      | Open until L06/L04/M05 and the generator route are separately closed.                                                                                                                                                                                                  |
| Natural backjump/refactor layer        | If tests require new generator semantics, backjump to the canonical generator layer;<br>do not patch the test module.                                                                                                                                                  |
| Implementation prompt contract         | Before code: provide module manifest, reuse audit, concrete finite instances, and test matrix rows;<br>do not create duplicate generators.                                                                                                                             |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                            |

|                                      |                                                                                                                                                                                                                                                                                                               |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| How implemented                      | Decision lock added to the YAML master and generated views;<br>no Lean code was changed.                                                                                                                                                                                                                      |
| Verification / evidence              | YAML/master validation and generated-view compilation;<br>no Lean build run.                                                                                                                                                                                                                                  |
| Build result                         | No Lean build executed.                                                                                                                                                                                                                                                                                       |
| Post-implementation plan check       | After implementation, verify the test matrix uses code-defined branching and did not duplicate generator logic.                                                                                                                                                                                               |
| Artifact packaging rule              | Return complete zip;<br>no Lean-build success may be claimed unless actually run.                                                                                                                                                                                                                             |

### Phase 1.1.1.1.0.10 – General early finite computation test-matrix contract and non-specialization lock

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                         |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #d9ead3;">G</span>                                                                                                                                              |
| Context class                         | LeanGovernancePhase                                                                                                                                                                            |
| Phase documentation tier              | F1                                                                                                                                                                                             |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                             |

| Implementation status                 | completed                                                                                                                                                                                      |
| Preparation status                    | closed-infrastructure-contract                                                                                                                                                                 |
| Phase type                            | infrastructure                                                                                                                                                                                 |
| Phase-type-specific contract          | Global test-governance contract;<br>it adds required fields to later derivation/refactor manifests but does not itself implement Lean code.                                                    |
| Title / state                         | General early finite computation test-matrix contract and non-specialization lock                                                                                                              |
| Preparation workflow                  | General finite computation-test workflow;<br>extends the concrete computable instance traversal workflow.                                                                                      |

|                                        |                                                                                                                                                                                                                                                                                    |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Source-to-CNNA mapping                 | The post-97 Eisenstein/Gauss rows map to sentinel rows;<br>the governing CNNA object is now the general finite computation test matrix O07. L09/L10/M08/BR10 remain specialized later consumers.                                                                                   |
| Dependency-depth audit                 | Must precede Phase 1.1.1.1.1 because module manifests must decide where generic tests live before code is written. It does not depend on later CM/j phases except for sentinel comparison columns.                                                                                 |
| Phase split decision                   | Added as its own green infrastructure gate because the requirement changes test semantics globally, not only Phase 8.5.                                                                                                                                                            |
| Positive path plan                     | Use generic tests first: construct finite generated instances, run the operational/computable path, export rational/integer/finite witnesses, then attach sentinel rows such as Eisenstein/Gauss as comparison rows where dependencies permit.                                     |
| Refactor regression protocol           | No code movement here. Later refactors must keep generic test rows buildable as migration sentinels.                                                                                                                                                                               |
| Refactor migration metrics             | Future refactor phases must report declarations migrated plus generic/sentinel test rows still passing.                                                                                                                                                                            |
| Lean/mathlib version policy            | Version impacts are logged per test field. A mathlib upgrade may be required only at phase boundaries, never inside a half-migrated test harness.                                                                                                                                  |
| ExecComplex boundary policy            | EXEC-2 binding: generic operational fields are finite/rational/integer;<br>non-rational geometry remains mirror/comparison.                                                                                                                                                        |
| Consumer-contract direction            | Tests consume canonical generator and operational profiles. They do not define generator semantics.                                                                                                                                                                                |
| Governance-overhead review             | This gate is justified only if it prevents special-case tunnel vision during the first computation phases;<br>review after first real code-test package.                                                                                                                           |
| Proof rehearsal before implementation  | A future test closes only if at least one generic row family is generated from code-defined data, not hand-coded to the expected CM result. Sentinel rows may fail without invalidating the generic test harness;<br>generic rows failing blocks promotion of the computable path. |
| Expected tactics                       | Not a Lean proof phase. Future Lean tests should prefer explicit constructors, finite enumerations, and proof-carrying row records over rewriting chains.                                                                                                                          |
| Expected mathlib imports               | No new mathlib import now. Future test modules must log whether finite matrix, polynomial, or number-theory APIs force noncomputable pressure.                                                                                                                                     |
| ExecComplex/computable plan            | Operational test fields remain finite/rational/integer. Algebraic coordinates, tau, sqrt(D), analytic j, and non-rational angles are mirror/comparison fields only.                                                                                                                |
| Concrete computable instance traversal | Defines the global obligation: every operational computable phase must include or point to finite generated rows that actually traverse the path, not only typecheck a skeleton.                                                                                                   |
| Computable path non-skeleton status    | strengthened: a path is non-skeletal only when a concrete finite input produces a proof-carrying executable witness or an explicitly documented failure row.                                                                                                                       |
| Expected executable witness            | Generic row witness: finite input record -> output record with rational/integer/finite fields and proof/status flags;<br>sentinel comparison fields are separate.                                                                                                                  |
| Mathlib complication log               | Future rows must log mathlib/noncomputable barriers per field, especially matrix inverses, polynomial APIs, discriminant APIs, and analytic j/elliptic APIs.                                                                                                                       |
| Noncomputable boundary audit           | Any noncomputable pressure must be isolated to mirror/comparison layer or trigger a natural refactor;<br>it cannot leak into operational row generation.                                                                                                                           |
| Mathlib mitigation/refactor layer      | Prefer executable finite constructors and proof-carrying row records. Use mirror layer for analytic/algebraic-irrational targets.                                                                                                                                                  |
| Bridge gap status                      | This closes a planning gap: v32 had specialized lattice-test phases, but lacked a general early test-matrix obligation for all computable paths.                                                                                                                                   |
| Natural backjump/refactor layer        | If a future test requires a duplicate generator or hand-coded special branch logic, backjump to the canonical generator layer or module manifest instead of patching in the test module.                                                                                           |
| Implementation prompt contract         | Before implementing a computation phase, specify the generic test matrix rows, code-defined input generator, finite instance coverage, expected executable witness, and sentinel rows separately.                                                                                  |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                        |
| How implemented                        | Added as a planning/infrastructure contract. It generalizes the v32 Eisenstein/Gauss test idea: those rows become sentinel cases in a broader finite test matrix over the code-defined generator/branching API, static/dynamic branch modes, L_max rows, and executable witnesses. |
| Verification / evidence                | YAML validation target: phase inserted before active cursor;<br>no white predecessors before active cursor;<br>LEG29/O07 registered with proof dossiers;<br>workflow/global guardrail/format decisions updated.                                                                    |
| Proof strategy                         | Planning proof: check that generic finite test-matrix obligations are required before special sentinel rows can close;<br>check that the phase/order does not feed heuristic data into generator semantics.                                                                        |
| Build result                           | No Lean build. PDF generation only after table regeneration.                                                                                                                                                                                                                       |
| Post-implementation plan check         | After the first code-change phase, review whether generic finite tests caught an architectural error and whether the harness should be flattened for later phases.                                                                                                                 |
| Artifact packaging rule                | Return full zip;<br>do not claim Lean build success unless executed locally/currently.                                                                                                                                                                                             |
| Implementation notes                   | This is not a mathematical theorem and not a Lean implementation. It prevents the first computation phases from becoming special-case demonstrations instead of general computable-path tests.                                                                                     |

| Phase-type-specific contract          | infrastructure lock for regime-typed tests                                                                                                                                                                                              |
| Title / state                         | Regime-typed early test matrix and Heegner-projection lock                                                                                                                                                                              |
| Preparation workflow                  | regime-typed general early finite computation test workflow                                                                                                                                                                             |
| Source-to-CNNA mapping                | Eisenstein/Gauss map to closed-root sentinel candidates only after noOuter/empty-set REAL-root route exists. Other Heegner or CM targets map to complement-projection/comparison rows unless a noOuter derivation is separately proven. |
| Dependency-depth audit                | No early mathematics consumes the classification as an input. It is a test/reporting schema before implementation and a proof target later.                                                                                             |
| Phase split decision                  | split from v33 O07 because generic-vs-sentinel is not enough; regime typing is a separate semantic axis.                                                                                                                                |
| Positive path plan                    | First run generic finite rows; then annotate rows by derived regime; then interpret Eisenstein/Gauss as noOuter-root sentinels and all other Heegner/CM rows as projections/comparison until proven otherwise.                          |
| Module implementation manifest        | pending Phase 1.1.1.1.1                                                                                                                                                                                                                 |
| Semantic placement decision           | test/schema layer, not generator layer                                                                                                                                                                                                  |

| Phase type                            | infrastructure                                                                                                                                                                                          |
| Phase-type-specific contract          | infrastructure scalar architecture obligations                                                                                                                                                          |
| Title / state                         | Computable scalar architecture decision: ExecComplex boundary, required exact quadratic layer, and Cayley-Dickson noncircularity lock                                                                   |
| Preparation workflow                  | computable scalar architecture workflow                                                                                                                                                                 |
| Source-to-CNNA mapping                | ExecComplex remains O00. Exact quadratic layer is O09 if needed. CD-derived C layer is CD9/10.4.3 only, not a replacement for O00.                                                                      |
| Dependency-depth audit                | Scalar architecture decisions must precede code implementation. Exact quadratic or CD scalar routes may not feed earlier generator definitions.                                                         |
| Phase split decision                  | split out because ExecComplex limits affect Phase 1.2, 4, 5, 7, 8 and CD bridges differently.                                                                                                           |

|                                        |                                                                                                                                                                                                          |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positive path plan                     | Keep current QxQ path first;<br>plan exact quadratic support as required for CM/lattice coordinates, but split schema from D-instantiation and keep analytic Complex mirror-only.                        |
| Module implementation manifest         | pending Phase 1.1.1.1.1                                                                                                                                                                                  |
| Semantic placement decision            | scalar-foundation / bridge governance, not generator semantics                                                                                                                                           |
| Reuse and duplication audit            | must check existing ExecComplex, ExecComplexBridge, Schur.CharpolyC, ArithmeticCDBridge, and mathlib QuadraticAlgebra before proposing new module                                                        |
| Canonical generator policy             | scalar layer must consume canonical generator outputs only;<br>cannot define generator semantics                                                                                                         |
| Module compactness rule                | do not create ExactQuadraticComplex unless existing foundation/bridge modules cannot carry the semantics cleanly                                                                                         |
| Refactor regression protocol           | no code movement in this gate                                                                                                                                                                            |
| Refactor migration metrics             | not applicable at planning gate                                                                                                                                                                          |
| Lean/mathlib version policy            | 4.28.0 baseline unless version gate explicitly opens upgrade                                                                                                                                             |
| ExecComplex boundary policy            | EXEC-3/4 enforced: QxQ floor;<br>exact quadratic required downstream;<br>no free sqrt(D);<br>analytic Complex mirror-only.                                                                               |
| Consumer-contract direction            | scalar layer consumes generator/arithmetic source data;<br>generator definitions do not consume scalar comparison/mirror data                                                                            |
| Governance-overhead review             | review after first scalar/module manifest whether this lock forced a concrete decision.                                                                                                                  |
| Proof rehearsal before implementation  | Proof by dependency order: before any scalar code, classify each scalar requirement as QxQ, exact quadratic, invariant projection, or mirror-only.                                                       |
| Expected tactics                       | explicit structures, constructor/projection lemmas, ring-normal-form only for coordinate arithmetic, no Matrix.inv and no consumer-side patch.                                                           |
| Expected mathlib imports               | Mathlib.Algebra.QuadraticAlgebra only if pilot approved;<br>Mathlib.Data.Complex.Basic remains bridge/mirror-only;<br>NumberField modules require version-policy gate.                                   |
| ExecComplex/computable plan            | QxQ computations remain primary. Exact quadratic computations are not optional for later CM/lattice coordinates, but O09 is only a parameterized schema until O10/BR14 supply a proof-carrying D-source. |
| Concrete computable instance traversal | required later: QxQ baseline row, Q(i) row, Q(sqrt(-3)) row, and at least one generic D row if O09 is implemented                                                                                        |
| Computable path non-skeleton status    | future implementation must provide executable witnesses;<br>planning gate only now                                                                                                                       |
| Expected executable witness            | finite row with rational ExecComplex output plus optional exact quadratic coordinate and rational/integer invariant projection                                                                           |
| Mathlib complication log               | Record Complex/Real noncomputable boundary, QuadraticAlgebra instance diamond warning, NumberField formal/non-executable dependency, and any required version-gate.                                      |
| Noncomputable boundary audit           | General C/R and algebraic closure remain mirror/formal. Exact quadratic candidate must avoid noncomputable definitions on operational path.                                                              |
| Mathlib mitigation/refactor layer      | Use project-owned explicit Q-coordinate structure or narrowly wrapped QuadraticAlgebra;<br>isolate formal mathlib NumberField in mirror/proof layer.                                                     |
| Bridge gap status                      | Open until O09/BR13/CD9 are implemented or rejected.                                                                                                                                                     |
| Natural backjump/refactor layer        | If exact quadratic data are needed, backjump to scalar-foundation layer rather than patching arithmetic/lattice consumers.                                                                               |
| Implementation prompt contract         | Before Lean code, module manifest must state exact module placement, imported mathlib modules, and why no existing module owns the semantics.                                                            |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                              |
| How implemented                        | Completed as planning/infrastructure lock in YAML;<br>no Lean code change.                                                                                                                               |
| Verification / evidence                | Generated-table validation pending/run after patch;<br>no Lean build.                                                                                                                                    |
| Proof strategy                         | planning-level dependency/order lock;<br>implementation proof obligations deferred to target phase                                                                                                       |
| Build result                           | No Lean build executed or claimed.                                                                                                                                                                       |
| Post-implementation plan check         | Check whether the scalar architecture lock prevented analytic/noncomputable leakage or duplicate scalar implementation.                                                                                  |
| Artifact packaging rule                | Return complete zip;<br>Lean build local unless actually executed here.                                                                                                                                  |
| Implementation notes                   | Added EXEC-3 scalar architecture lock and future O09/BR13/CD9 phases.                                                                                                                                    |

|                                      |                                                                                                                                                                                                                               |

### Phase 1.1.1.1.0.13 – Derived-only exact quadratic algebra provenance lock: no free sqrt(D)

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase-type-specific contract          | infrastructure phase: obligations recorded in proof and scratchpad fields.                                                                                                                                              |
| Title / state                         | Derived-only exact quadratic algebra provenance lock: no free sqrt(D)                                                                                                                                                   |
| Preparation workflow                  | Planned phase. Use source-preparation workflow before implementation: attach reliable sources, extract established objects, audit dependencies, split if necessary, and fill proof rehearsal before changing Lean code. |
| Source-to-CNNA mapping                | QuadraticAlgebra/AdjoinRoot supply reference patterns for adjoining a generator by a relation; CNNA uses them only after D has been derived by the operational Schur/DtN/arithmetic path.                               |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependency-depth audit                 | This gate must be green before the active module manifest: exact quadratic support is required later, but only downstream of O05/O06 or equivalent proof-carrying D-source. CD and analytic Complex cannot be upstream scalar sources.                                |
| Phase split decision                   | Closed decision gate.                                                                                                                                                                                                                                                 |
| Positive path plan                     | Do not postpone the need for exact quadratic data; plan it as required. But implement only a parameterized schema first, then instantiate it only after the operational discriminant ledger produces D.                                                               |
| Refactor regression protocol           | Apply global refactor regression protocol if code changes.                                                                                                                                                                                                            |
| Refactor migration metrics             | Pending or not applicable.                                                                                                                                                                                                                                            |
| Lean/mathlib version policy            | Use frozen Lean/mathlib baseline unless a phase-boundary upgrade gate is opened.                                                                                                                                                                                      |
| ExecComplex boundary policy            | EXEC-3/4 enforced: QxQ floor; exact quadratic required but discriminant-indexed; no free sqrt(D).                                                                                                                                                                     |
| Consumer-contract direction            | No consumer-side patch; missing D-source belongs earlier.                                                                                                                                                                                                             |
| Governance-overhead review             | Pending or not applicable.                                                                                                                                                                                                                                            |
| Proof rehearsal before implementation  | Given D from a ledger, define theta formally by a coordinate algebra with $\theta^2 = D$ . Prove coordinate addition, multiplication, conjugation, trace, norm, and allowed projection lemmas. No theorem may mention a free sqrt(D) object.                          |
| Expected tactics                       | No Lean tactics; planning lock only.                                                                                                                                                                                                                                  |
| Expected mathlib imports               | No import in this planning gate. Later implementation may audit Mathlib.Algebra.QuadraticAlgebra; AdjoinRoot is proof/mirror reference unless an executable wrapper is explicitly justified.                                                                          |
| ExecComplex/computable plan            | ExecComplex keeps rational/integer shadows. O09 carries exact quadratic coordinates only with a D-source; BR13/BR14 project trace/norm/discriminant/integer invariants back to allowed operational rows.                                                              |
| Concrete computable instance traversal | Later required rows: D=-1 for Gauss-like Q(i) if code source produces it, D=-3 for Eisenstein, D=-4 depending on discriminant convention, and at least one generic nonsquare D; every row must cite its D-ledger.                                                     |
| Computable path non-skeleton status    | planning lock only; operational witnesses required later                                                                                                                                                                                                              |
| Expected executable witness            | Future witnesses: D=-3, D=-4 and generic D rows only after proof-carrying D-source.                                                                                                                                                                                   |
| Mathlib complication log               | QuadraticAlgebra has coordinate operations suitable as reference; AdjoinRoot quotient construction may introduce noncomputable instances and is therefore not automatically operational.                                                                              |
| Noncomputable boundary audit           | No analytic Complex, Real, algebraic closure, or uninspected AdjoinRoot field structure may become operational. Any noncomputable mathlib dependency belongs to mirror/proof layer unless isolated.                                                                   |
| Mathlib mitigation/refactor layer      | Prefer project-owned executable coordinate layer or tightly audited mathlib wrapper.                                                                                                                                                                                  |
| Bridge gap status                      | Open theorem work is registered in O09/O10/BR14. The planning lock itself is closed.                                                                                                                                                                                  |
| Natural backjump/refactor layer        | If a D-source is missing, backjump to discriminant source, not to scalar consumer.                                                                                                                                                                                    |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                              |
| How implemented                        | No implementation record. The phase is a planning row only and must remain untouched until it becomes the unique active frontier.                                                                                                                                     |
| Verification / evidence                | Not applicable yet.                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | Completed for planning lock only.                                                                                                                                                                                                                                     |
| Artifact packaging rule                | Return a full zip; do not claim Lean build unless executed or explicitly user-reported green.                                                                                                                                                                         |
| Implementation notes                   | When activated, first check dependency depth and split into subphases if the target consumes too many objects or proof layers.                                                                                                                                        |

**Phase 1.1.1.1.0.14 – Phase 5-10 dependency bifurcation lock: number-theory/modular path separated from spectral/physical consumers**

**Table legend.**   G = green/closed and derived-only;   W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   O = orange/implementable after stated predecessor closure;   Y = yellow/active and implementable now;   R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                               |

| Preparation status                    | completed                                                                                                                                                                                                                            |
| Phase type                            | infrastructure                                                                                                                                                                                                                       |
| Phase-type-specific contract          | infrastructure contract: dependency and object placement must be explicit and minimal.                                                                                                                                               |
| Title / state                         | Phase 5-10 dependency bifurcation lock: number-theory/modular path separated from spectral/physical consumers                                                                                                                        |
| Preparation workflow                  | phase dependency bifurcation and semantic placement workflow                                                                                                                                                                         |
| Source-to-CNNA mapping                | Object phase placement must match actual source objects, not legacy narrative phase titles.                                                                                                                                          |
| Dependency-depth audit                | No spectral/physical object may depend on modular forms or j unless its proof target explicitly consumes them.                                                                                                                       |
| Phase split decision                  | Split because phase 9 mixed modular and physical consumers and phase 10 mixed modular, spectral, transfer, analytic and bridge targets.                                                                                              |
| Positive path plan                    | Keep parallel paths after Phase 4;<br>close each path on its own proof-carrying prerequisites.                                                                                                                                       |
| Module implementation manifest        | No Lean implementation manifest was required when this already-closed/planned infrastructure row was created;<br>under closed LEG10, any future code change touching this phase must fill exact added/modified modules before edits. |
| Semantic placement decision           | Existing placement remains historical/planning-only. Future module placement must be revalidated by LEG10 before code changes.                                                                                                       |
| Reuse and duplication audit           | Not a generator implementation. If later code resembles an existing generator/API, consume LEG11 before edits.                                                                                                                       |
| Canonical generator policy            | No generator-like code in this record. Future generator-like extensions must route through LEG11.                                                                                                                                    |
| Module compactness rule               | No one-phase-one-file inference;<br>future modules require semantic/API/import-boundary justification.                                                                                                                               |
| Refactor regression protocol          | incremental wrapper mode;<br>full local build green after each migration step                                                                                                                                                        |
| Refactor migration metrics            | track object reassignments, phase dependency changes, and consumer-path imports                                                                                                                                                      |
| Lean/mathlib version policy           | 4.28.0 baseline unless version gate explicitly opens upgrade                                                                                                                                                                         |
| ExecComplex boundary policy           | Phase 4.1 finite matrix is enough for spectral/physical finite consumers;<br>modular/CM analytics remain separate.                                                                                                                   |

|                                        |                                                                                                                                                                                 |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consumer-contract direction            | Phase 10 consumes Phase 4.1 directly;<br>Phase 8/9 do not gate Phase 10 unless a specific object bridge says so.                                                                |
| Governance-overhead review             | Review after first Phase 10 finite consumer whether the bifurcation prevented a false wait on Phase 8/9.                                                                        |
| Proof rehearsal before implementation  | For each object, list minimal existing sources and reject any extra phase dependency not used by the proof target.                                                              |
| Expected tactics                       | planning/generator validation now;<br>later Lean proofs use constructor/projection lemmas over source objects only.                                                             |
| Expected mathlib imports               | none for planning lock                                                                                                                                                          |
| ExecComplex/computable plan            | Spectral/physical finite profiles consume Phase 4.1 ExecBoundaryMatrix;<br>modular forms/CM consume lattice/number-theory path separately.                                      |
| Concrete computable instance traversal | Future finite test rows must run separately for arithmetic/modular and spectral/physical consumers.                                                                             |
| Computable path non-skeleton status    | Must be demonstrated by finite rows over Phase 4.1 matrix for spectral/physical path and by D/CM rows for modular path.                                                         |
| Expected executable witness            | At least one finite ExecBoundaryMatrix spectral profile row and at least one D-to-modular comparison row when those phases activate.                                            |
| Mathlib complication log               | Record if modular-form/mathlib APIs are attempted in spectral/physical path;<br>that is a placement smell unless explicitly justified.                                          |
| Noncomputable boundary audit           | Analytic modular/j/L-function objects remain mirror/comparison and cannot block finite spectral/operator algebra profiles.                                                      |
| Mathlib mitigation/refactor layer      | Use separate path modules;<br>do not import modular APIs into finite physical consumers for convenience.                                                                        |
| Bridge gap status                      | Open bridge objects remain late and cannot force early path sequentialization.                                                                                                  |
| Natural backjump/refactor layer        | If a consumer needs a source from another path, add an explicit bridge dependency rather than moving the whole phase behind that path.                                          |
| Implementation prompt contract         | Before implementing any phase, module manifest must state exact source phase IDs and must not inherit unrelated predecessor chains.                                             |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                     |
| How implemented                        | Planning-only architecture/order update;<br>no Lean code moved.                                                                                                                 |
| Verification / evidence                | Generated-table validation after v37 patch;<br>no Lean build.                                                                                                                   |
| Proof strategy                         | Treat phase dependency as provenance obligation;<br>split unrelated consumers rather than sequentializing them through non-required objects.                                    |
| Build result                           | No Lean build executed or claimed.                                                                                                                                              |
| Post-implementation plan check         | After first Phase 4/10 implementation, verify that no M-object import or j target appears in the physical path unless explicitly justified.                                     |
| Artifact packaging rule                | Return complete zip;<br>Lean build local unless actually executed here.                                                                                                         |
| Implementation notes                   | Records dependency and topic-boundary decision before code implementation.                                                                                                      |

| Preparation status                    | completed                                                                                                                                                                                      |
| Phase type                            | infrastructure                                                                                                                                                                                 |
| Phase-type-specific contract          | Global generator/view consistency phase: must create validation/display logic rather than mathematical declarations.                                                                           |
| Title / state                         | Global phase-object-link policy and no-empty-linked-object-cell contract                                                                                                                       |
| Preparation workflow                  | Phase-object-link policy infrastructure was inserted before the active module-manifest phase so implementation cannot start with ambiguous phase/object table semantics.                       |
| Source-to-CNNA mapping                | Generator display problem -> global planning invariant LEG34;<br>direct object ownership remains object.Phase == phase.Phase;<br>child objects are only scope summaries.                       |
| Dependency-depth audit                | Depends only on existing planning data and generator output;<br>no mathematical phase is re-ordered.                                                                                           |
| Phase split decision                  | Added as 1.1.1.1.0.15 because it is a global view/validation lock that must precede implementation manifest work.                                                                              |
| Positive path plan                    | Use generated validation, not manual interpretation, to keep phase/object ownership visible and auditable.                                                                                     |
| Module implementation manifest        | No Lean module manifest;<br>generator/documentation-only phase.                                                                                                                                |
| Semantic placement decision           | Belongs to global planning infrastructure, not to mathematical object phases.                                                                                                                  |
| Reuse and duplication audit           | Reuses existing phase hierarchy and object register. No duplicate object registry created.                                                                                                     |
| Canonical generator policy            | The table generator is the canonical renderer of phase-object link semantics.                                                                                                                  |
| Module compactness rule               | Keep policy in the generator and YAML fields;<br>avoid a separate manual table source.                                                                                                         |
| Refactor regression protocol          | View regression: no unqualified blank Linked objects cell may remain after table generation.                                                                                                   |
| Refactor migration metrics            | Policies assigned to every phase;<br>direct/scope_only/no_direct_object/moved counts recorded in report.                                                                                       |
| Lean/mathlib version policy           | not applicable                                                                                                                                                                                 |
| ExecComplex boundary policy           | not applicable                                                                                                                                                                                 |
| Consumer-contract direction           | Planning views consume object register and phase hierarchy;<br>object register does not consume table-rendered child scope.                                                                    |
| Governance-overhead review            | Justified because the prior table display could falsely suggest missing objects or broken phase coverage.                                                                                      |
| Proof rehearsal before implementation | Show that every phase has one of four cases: direct, scope_only, no_direct_object, moved. Each case has a different rendering and validator obligation.                                        |
| Expected tactics                      | Python generator validation;<br>YAML structural audit;<br>no Lean tactics.                                                                                                                     |

|                                        |                                                                                                                                                                                                                                                  |

| Noncomputable boundary audit           | none;<br>no Lean code                                                                                                                                                                                                                            |
| Mathlib mitigation/refactor layer      | none                                                                                                                                                                                                                                             |
| Bridge gap status                      | closes the display/ownership gap that made scope-only phases look empty                                                                                                                                                                          |
| Natural backjump/refactor layer        | If a phase unexpectedly loses all direct objects, update the object Phase assignment or declare the correct non-direct policy before generating views.                                                                                           |
| Implementation prompt contract         | Before code work, verify that the phase has a clear object-link policy and that the module manifest references direct or child-scope objects correctly.                                                                                          |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                      |
| How implemented                        | Planning generator and YAML schema updated: phases carry Object link policy/explanation/child scope;<br>phase table renders direct objects, scope-only child summaries, no-direct-object explanations, or moved placeholders.                    |
| Verification / evidence                | YAML has explicit policy fields for every phase;<br>generator validates allowed policy kinds and renders the phase table without raw blank Linked objects cells.                                                                                 |
| Proof strategy                         | Treat phase-object display as a generated invariant: empty direct-object sets require explicit phase policy, not silence.                                                                                                                        |
| Build result                           | PDF view generated;<br>no Lean build executed.                                                                                                                                                                                                   |
| Post-implementation plan check         | Future generator runs must fail or visibly explain if a phase has no direct linked object.                                                                                                                                                       |
| Artifact packaging rule                | Return complete zip and PDF view;<br>do not claim Lean build.                                                                                                                                                                                    |
| Implementation notes                   | This is planning/documentation infrastructure only. It does not change Lean code and does not alter object ownership. Direct ownership remains controlled exclusively by the object register Phase field.                                        |

### Phase 1.1.1.1.0.16 – Global ontic subsystem-minimality postulate and emergence-order lock

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                           |

| Implementation status                 | completed                                                                                                                                                                                                                                        |
| Preparation status                    | completed                                                                                                                                                                                                                                        |
| Phase type                            | infrastructure                                                                                                                                                                                                                                   |
| Phase-type-specific contract          | Global ontology/provenance lock: creates planning constraints, not mathematical Lean declarations.                                                                                                                                               |
| Title / state                         | Global ontic subsystem-minimality postulate and emergence-order lock                                                                                                                                                                             |
| Preparation workflow                  | Inserted as a green decision lock before module-manifest implementation, so code planning cannot start with ambiguous ontic premises.                                                                                                            |
| Source-to-CNNA mapping                | User formulation -> POST1 global postulate;<br>allowed primitive = subsystem/cut/approximant selection within IDEAL_infty;<br>derived consequences = boundary, complement, Schur/DtN, spectra, algebra, arithmetic, geometry, dynamics, physics. |
| Dependency-depth audit                | Depends only on already established planning/regime/complement discipline. It does not reorder mathematics;<br>it constrains all future derivation and consumer phases.                                                                          |
| Phase split decision                  | Added as 1.1.1.1.0.16 because this is a global architecture/postulate lock that must precede active implementation.                                                                                                                              |
| Positive path plan                    | Use subsystem-being as the minimal emergence trigger. Let Schur/DtN/complement/regime machinery generate all later structures rather than importing them.                                                                                        |
| Module implementation manifest        | No Lean module manifest;<br>planning/postulate infrastructure only.                                                                                                                                                                              |
| Semantic placement decision           | Belongs to global postulates and no-go guardrails before active implementation.                                                                                                                                                                  |
| Reuse and duplication audit           | Reuses global no-go, workflow, proof-dossier and generated-table infrastructure;<br>no duplicate roadmap source.                                                                                                                                 |
| Canonical generator policy            | The table generator is the canonical renderer of POST1 and its supporting enforcement objects.                                                                                                                                                   |
| Module compactness rule               | Keep the postulate in one top-level section plus LEG35/GNG22 references;<br>avoid scattering prose copies.                                                                                                                                       |
| Refactor regression protocol          | Generated views must keep POST1 visible and GNG22 inherited;<br>no code refactor may remove the global postulate from generated documentation.                                                                                                   |

|                                        |                                                                                                                                                                                                                                                                           |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refactor migration metrics             | One postulate, one object, one phase lock, one no-go, one workflow added.                                                                                                                                                                                                 |
| Lean/mathlib version policy            | not applicable                                                                                                                                                                                                                                                            |
| ExecComplex boundary policy            | ExecComplex is downstream of subsystem-derived computation;<br>no scalar layer is ontic primitive.                                                                                                                                                                        |
| Consumer-contract direction            | Consumer phases consume derived operator/spectral/algebraic/arithmetic data only after subsystem/cut provenance exists.                                                                                                                                                   |
| Governance-overhead review             | Justified because the rule prevents the project from importing the very structures it aims to derive.                                                                                                                                                                     |
| Proof rehearsal before implementation  | Check any object that mentions dynamics, spectra, algebra, arithmetic, geometry, stochasticity, openness, unitarity or physics. If its source chain does not begin at subsystem/cut and pass through the required generating layers, mark it comparison-only or backjump. |
| Expected tactics                       | YAML/generator validation;<br>proof-dossier audit;<br>no Lean tactics in this planning phase.                                                                                                                                                                             |
| Expected mathlib imports               | none                                                                                                                                                                                                                                                                      |
| ExecComplex/computable plan            | ExecComplex remains downstream computational carrier;<br>it does not supply ontic primitives. Concrete computable paths must start from finite subsystem instances.                                                                                                       |
| Concrete computable instance traversal | Planning-level concrete instance: trace a finite subsystem/cut -> boundary -> complement/regime -> Schur/DtN -> derived consumer chain for later active phases.                                                                                                           |
| Computable path non-skeleton status    | The postulate explicitly requires concrete subsystem instances before computational consumer claims;<br>it rejects skeleton-only computational paths.                                                                                                                     |
| Expected executable witness            | python scripts/generate_tables.py renders POST1 and exports global_postulates.generated.tsv.                                                                                                                                                                              |
| Mathlib complication log               | none for the postulate. Later mathlib complications must not be solved by importing non-derived primitives.                                                                                                                                                               |
| Noncomputable boundary audit           | No Lean code. Later noncomputable/mirror boundaries must remain downstream of derived subsystem provenance.                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | none here;<br>later phases must backjump to natural generating layer if mathlib forces inappropriate primitives.                                                                                                                                                          |
| Bridge gap status                      | closes the ontic-primitivity gap: prevents later phases from treating physics/dynamics/arithmetic/geometry/environment as inputs.                                                                                                                                         |
| Natural backjump/refactor layer        | If a consumer needs a non-subsystem structure without provenance, backjump to the cut/regime/complement/Schur source layer rather than patching the consumer.                                                                                                             |
| Implementation prompt contract         | Before implementing any phase, state which structures are primitive, derived, or comparison-only. Only subsystem-being may be primitive.                                                                                                                                  |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                               |
| How implemented                        | Added POST1 global postulate, LEG35 object/dossier, GNG22 global no-go, ontic subsystem-minimality workflow and generated global-postulate rendering before the active implementation phase.                                                                              |
| Verification / evidence                | YAML contains global_postulates.POST1, LEG35, GNG22, and a green phase 1.1.1.1.0.16 before the active cursor. Generator validates and renders the global postulate table.                                                                                                 |
| Proof strategy                         | Treat ontology as a global provenance invariant: non-subsystem structures must be classified as derived consequences or comparison-only readings, never as primitive inputs.                                                                                              |
| Build result                           | PDF view generated;<br>no Lean build executed.                                                                                                                                                                                                                            |
| Post-implementation plan check         | Future phase closures must record derived provenance for all non-subsystem structures or mark them comparison-only.                                                                                                                                                       |
| Artifact packaging rule                | Return complete zip and PDF view;<br>do not claim Lean build.                                                                                                                                                                                                             |
| Implementation notes                   | Planning/documentation infrastructure only. It does not introduce Lean axioms. The postulate constrains the plan: subsystem-being is the only primitive emergence trigger;<br>all other structures require derived provenance.                                            |

| Title / state                          | Implementation module manifest and semantic placement gate                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Preparation workflow                   | Active module-manifest gate after global guardrail inheritance lock.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Source-to-CNNA mapping                 | LEG10 governs all later implementation phases. It is not mathematics; it is a provenance/API hygiene contract preventing code fragmentation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Dependency-depth audit                 | Depends on green parents 1.1.1.1, 1.1.1.1.0, and decision locks 1.1.1.1.0.1-1.1.1.1.0.13. No implementation may start until module names/budget, phase_type, regression mode, version impact, consumer direction, concrete-instance status, and mathlib complication status are explicit.                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Phase split decision                   | New child gate inserted before 1.1.1.1.2 and 1.1.1.1.3. No further split unless a separate generated manifest table becomes necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Positive path plan                     | Define the manifest: for each future implementation phase, list proposed added modules, modified modules, exact names, semantic placement, phase_type, type-specific obligations, reuse/extension/rejection decision, public/legacy/API role, import direction, regression protocol, version impact, and expected downstream consumers. Include a rule that any future bridge theorem must list whether it is an upstream generator input, downstream consumer, or comparison-only diagnostic. Additionally, every proposed computation module must include a generic finite test-matrix placement decision: whether it reuses O07, extends the canonical smoke-test generator, or documents why no executable test applies yet. |
| Module implementation manifest         | Closed contract: every scratchpad record must expose proposed_added_modules, proposed_modified_modules, reusable_existing_modules, semantic placement, rejection/fit decision, public/legacy/API role, import direction, expected downstream consumers, phase_type obligations, refactor regression protocol, version impact, concrete-instance traversal, generic test placement, mathlib complication log, and noncomputable boundary audit before Lean edits.                                                                                                                                                                                                                                                                 |
| Semantic placement decision            | The manifest is planning infrastructure and belongs to the single YAML master plus generated views. It is not a Lean module and must not be implemented as phase-local code. Future code modules are created only when an existing semantic module cannot be safely extended or wrapped.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Reuse and duplication audit            | Phase 1.1.1.1.1 names reusable candidates but defers semantic generator classification to 1.1.1.1.2. Duplicate implementation remains blocked already at manifest level.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Canonical generator policy             | Any generator-like phase must consume this manifest, then pass through 1.1.1.1.2 before Lean code. The manifest table must state whether O07/canonical smoke-test generator is reused, extended, or rejected.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Module compactness rule                | Closed rule: phase granularity is not file granularity. A later phase must justify every new module by semantic ownership, API/firewall direction, or unavoidable import split.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Refactor regression protocol           | This gate does not refactor code, but it must require every later refactor manifest to declare wrapper-first/incremental vs atomic mode. Default for 1.1.2 is wrapper-first incremental with local full-build evidence per package.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Refactor migration metrics             | The active gate must define the metric template, not fill counts yet: declarations_migrated_count; modules_added/modified; imports_changed; import_graph_delta; consumer_breakage_audit; compatibility_aliases; build evidence source.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Lean/mathlib version policy            | Every module manifest must state whether it stays on Lean 4.28.0/mathlib baseline, uses no mathlib change, or requires a separate upgrade gate.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| ExecComplex boundary policy            | EXEC-2/3/4 enforced: rational QxQ floor; exact quadratic layer is required later for CM/lattice coordinates but may only be instantiated from a proof-carrying discriminant ledger; analytic Complex and CD C-surfaces are not early scalar sources.                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Consumer-contract direction            | Every proposed public wrapper must state its expected consumers and import direction. BoundaryOperatorProfile must prepare for Phase 4.1 without importing Phase 4. For BR08/CD8 specifically, earlier route modules export data downstream and must not import the bridge.                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Governance-overhead review             | This gate is retained because it blocks concrete observed failure modes: one-phase-one-file proliferation, duplicate generator surfaces, hidden import direction, and unclassified mathlib/noncomputable pressure. Review flattening only after the first real code/refactor package closes.                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Proof rehearsal before implementation  | For a future phase, rehearse: target object -> existing module semantic scan -> either extend existing module or justify new module -> record consumer role -> only then implement.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Expected tactics                       | No Lean tactics expected. If mirrored as Lean audit constants later, use records with exact/rfl fields only.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Expected mathlib imports               | None. This planning gate uses generated repo inventory, not new mathlib imports.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| ExecComplex/computable plan            | No ExecComplex object introduced. The rule applies to future ExecComplex-touching phases: reuse existing boundary modules unless semantic placement proves otherwise.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Concrete computable instance traversal | This active gate is infrastructure-only: it will not introduce operational Lean code. For every later operational phase, the manifest must include a concrete finite instance path from generated input to intended endpoint. This phase must plan generic finite test traversal, not only special sentinels, for every upcoming computable path.                                                                                                                                                                                                                                                                                                                                                                                |
| Computable path non-skeleton status    | active infrastructure gate; it prevents later skeleton-only operational phases by requiring concrete instance traversal fields in every scratchpad.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Expected executable witness            | For this gate: generated manifest fields. For later operational phases: a named concrete finite generated instance and executable endpoint object.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Mathlib complication log               | No new mathlib import in this gate. Later manifests must list expected mathlib imports and whether each is executable, noncomputable-only, classical-only, or mirror-layer-only. Scalar architecture check added: any proposed new module must classify Complex/Real/QuadraticAlgebra dependencies under LEG31. Derived-quadratic update: any proposed QuadraticAlgebra/AdjoinRoot/ExactQuadratic module must state whether it is a schema, D-instantiation, proof/mirror reference, or executable coordinate layer.                                                                                                                                                                                                             |
| Noncomputable boundary audit           | No Lean operational code changed. Later phases must document noncomputable leakage risk before implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Mathlib mitigation/refactor layer      | If a proposed implementation needs noncomputable mathlib APIs, the manifest must route them to an allowed mirror/non-operational module or backjump to an operational replacement layer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Bridge gap status                      | No mathematical bridge. Missing semantic placement data blocks implementation, not mathematics.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |

|                                      |                                                                                                                                                                                                                                                                                                                                                            |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Natural backjump/refactor layer      | If implementation wants a new module but semantics fit an existing module, backjump to the existing module or neutral wrapper seam. If import direction prevents reuse, backjump to the earliest natural API/firewall layer.                                                                                                                               |
| Implementation prompt contract       | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation.                          |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                |
| How implemented                      | Closed as planning/generator infrastructure: the YAML scratchpad now has mandatory module-manifest fields, generate_tables.py validates them, and generated table/TSV views expose the compact module-placement contract before Lean edits.                                                                                                                |
| Verification / evidence              | scripts/generate_tables.py executed successfully for v40;<br>module_implementation_manifest table/TSV regenerated;<br>no Lean source changed;<br>no Lean build claimed.                                                                                                                                                                                    |
| Proof strategy                       | No Lean proof. Planning proof is generator-enforced semantic placement against the module inventory and scratchpad schema.                                                                                                                                                                                                                                 |
| Build result                         | Generated planning artifacts and PDF were regenerated;<br>no Lean build executed or claimed.                                                                                                                                                                                                                                                               |
| Post-implementation plan check       | Closed in v40. Active cursor moved to 1.1.1.1.2 reuse/generator audit;<br>later implementation phases must fill the manifest before code changes.                                                                                                                                                                                                          |
| Artifact packaging rule              | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                             |
| Implementation notes                 | Infrastructure-only closure. The gate creates no mathematical object, moves no Lean module, and exists to prevent code fragmentation before later implementation phases.                                                                                                                                                                                   |

### Phase 1.1.1.1.2 – Reuse and duplication audit with canonical theory/smoke-test generator policy

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked

Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                     |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

| Preparation status                    | completed                                                                                                                                                                                                                                                                                                  |
| Phase type                            | infrastructure                                                                                                                                                                                                                                                                                             |
| Phase-type-specific contract          | Infrastructure/planning phase: justify absence of operational witness; close schema/decision prerequisites before code.                                                                                                                                                                                    |
| Title / state                         | Reuse and duplication audit with canonical theory/smoke-test generator policy                                                                                                                                                                                                                              |
| Preparation workflow                  | Use LEG10 module manifest, symbol/reference summaries, existing Smoke/Test generator modules, and planned target semantics to decide consume/extend/wrap/genuine-split for every generator-like future phase.                                                                                              |
| Source-to-CNNA mapping                | LEG11 is now a generated governance object. It does not generate mathematics; it constrains future CNNA-derived-only implementations so that generator-like code extends the natural existing seam instead of forking provenance.                                                                          |
| Dependency-depth audit                | Closed after LEG10 because the module manifest now names reusable modules and duplicate-risk symbols. The audit classifies the existing smoke/generated source seam, action inventory seam, documentation generator, and future experiment/request-output work before any new generator code is permitted. |
| Phase split decision                  | No split needed for this gate. A later code phase may create a neutral generator API only if a concrete implementation phase proves the current Smoke namespace is too narrow while semantics are the same.                                                                                                |
| Positive path plan                    | Closed positive path: identify existing seams -> classify allowed use as consume/extend/wrap/genuine split -> record blocked duplication -> render ledger -> move active cursor to proof-documentation infrastructure.                                                                                     |
| Module implementation manifest        | Closed contract consumed from LEG10. v41 adds no Lean module; it extends the planning generator and YAML master to render the reuse/duplication ledger.                                                                                                                                                    |

|                                        |                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Semantic placement decision            | The policy belongs in the single YAML master and generated planning views. It must not be implemented as a phase-local Lean status module; later neutral generator code is allowed only after a concrete module-manifest proof.                                                                                                   |
| Reuse and duplication audit            | Closed: generator-like operations are classified by ledger rows as consume existing, extend existing, wrap existing, artifact-only split, or genuine semantic split. Duplicate generator implementations are blocked by default.                                                                                                  |
| Canonical generator policy             | Closed rule: the Smoke/GeneratedSource-MainPath seam is canonical for generated ToC/smoke semantics; action-like semantics reuse GeneratorActionInventory/ActionFormatDecision; documentation/inventory scripts are artifact generators and comparison/audit only.                                                                |
| Module compactness rule                | Closed rule: a generator policy row is not a new Lean file. Later code should prefer one coherent reusable generator/API seam plus wrappers over phase-local generator files.                                                                                                                                                     |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                 |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                       |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                        |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                          |
| Consumer-contract direction            | Exports a planning/API policy to 1.1.1.1.3, 1.1.1.3, Phase 5, O07, heuristic lattice tests, and all generator-like phases. It does not export mathematical data to downstream pillars.                                                                                                                                            |
| Governance-overhead review             | Retained: this gate blocks a concrete failure mode, namely duplicate generator/provenance surfaces. Review flattening only after the first real generator-consuming code phase closes under the ledger.                                                                                                                           |
| Proof rehearsal before implementation  | For future generator-like targets: first cite the ledger row; if semantics match the Smoke/GeneratedSource-MainPath seam, consume or extend it; if artifact-only, keep it in scripts/YAML; if action-like, consume GeneratorActionInventory/ActionFormatDecision; only then permit a recorded genuine semantic split.             |
| Expected tactics                       | No Lean tactics expected.                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | None.                                                                                                                                                                                                                                                                                                                             |
| ExecComplex/computable plan            | No ExecComplex object introduced. Future generated ExecComplex data must route through the canonical generator path where semantics match and remain under EXEC-2 operational Q x Q boundary rules.                                                                                                                               |
| Concrete computable instance traversal | Infrastructure-only; no operational finite instance is introduced. Future operational generator phases must provide concrete finite traversal through the canonical seam.                                                                                                                                                         |
| Computable path non-skeleton status    | not applicable for this planning gate; later operational generator code must provide executable witness rows before closure.                                                                                                                                                                                                      |
| Expected executable witness            | none for this infrastructure gate; future O07/Phase-5-like generator consumers must name one.                                                                                                                                                                                                                                     |
| Mathlib complication log               | No Lean/mathlib import is introduced by this phase.                                                                                                                                                                                                                                                                               |
| Noncomputable boundary audit           | No noncomputable boundary introduced; no Lean operational path changed.                                                                                                                                                                                                                                                           |
| Mathlib mitigation/refactor layer      | Not needed for this gate. If later generator code introduces mathlib/noncomputable pressure, isolate it at the earliest natural source layer or mirror/comparison layer.                                                                                                                                                          |
| Bridge gap status                      | Closed for governance. A possible future neutral generator API remains an implementation gap only if later code needs a namespace-neutral wrapper; it is not a license to create a parallel generator.                                                                                                                            |
| Natural backjump/refactor layer        | If a future consumer wants a new generator, backjump to the natural existing seam: Smoke/GeneratedSource-MainPath for generated ToC/smoke semantics, Actions/GeneratorActionInventory for action candidates, scripts/YAML for documentation artifacts, or a ledger-recorded genuine semantic split.                               |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation. |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                          |
| How implemented                        | Closed in v41 as a generated reuse/duplication ledger plus canonical generator policy. Added a YAML reuse_duplication_ledger section, generator-script validation/rendering, a PDF section, and TSV export. No Lean source was edited.                                                                                            |
| Verification / evidence                | python3 scripts/generate_tables.py completed successfully after adding reuse_duplication_ledger validation/rendering. pdflatex was run for the v41 PDF. Prior Lean build was user-reported green; this phase changed no Lean source and no Lean build is claimed from this environment.                                           |
| Proof strategy                         | Infrastructure proof by generated ledger coverage and validation: the YAML master owns the policy rows; generate_tables.py validates required columns and emits PDF/TSV views. No Lean proof is introduced.                                                                                                                       |
| Build result                           | User reported prior Lean build green. This phase changed no Lean source; no Lean build executed or claimed here.                                                                                                                                                                                                                  |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|--------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Post-implementation plan check       | LEG11 is documented and green;<br>generated ledger artifacts exist;<br>active cursor moves to 1.1.1.1.3 proof-documentation infrastructure. Later Phase 5/O07/heuristic lattice/generator-like work must pass through this policy before code.                                                                                                                                                                                                                                                                         |
| Artifact packaging rule              | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                         |
| Implementation notes                 | LEG11 now blocks parallel generator/request/output/extraction/ledger infrastructure by default. Future generator-like phases must classify their relation to the canonical seam before implementation.                                                                                                                                                                                                                                                                                                                 |

### Phase 1.1.1.1.3 – Object and quantities proof-documentation infrastructure gate

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                                                                                                                            |

| Preparation status                    | completed                                                                                                                                                                                                                                                                                                                                                                                                         |
| Phase type                            | documentation                                                                                                                                                                                                                                                                                                                                                                                                     |
| Phase-type-specific contract          | Documentation phase: record dossier coverage, verification/audit status, and links to code/object records; no mathematical object is generated by documentation alone.                                                                                                                                                                                                                                            |
| Title / state                         | Object and quantities proof-documentation infrastructure gate                                                                                                                                                                                                                                                                                                                                                     |
| Preparation workflow                  | Documentation is now a third workflow next to phase preparation and implementation. For every object or quantity, keep a proof dossier with source objects, definitions, proof target, proof sketch, and verification result.                                                                                                                                                                                     |
| Source-to-CNNA mapping                | LEG12 governs proof documentation. It does not introduce mathematical content; it makes object-level proof obligations trackable and linkable from the object register.                                                                                                                                                                                                                                           |
| Dependency-depth audit                | Now depends on closed 1.1.1.1.2/LEG11. Must precede final public declaration classification and blue-object promotion; otherwise duplicate generator decisions and undocumented proof-carrying blue objects could leak into the public surface.                                                                                                                                                                   |
| Phase split decision                  | Inserted between reuse/generator audit and final declaration classification. No Lean module is added unless the documentation infrastructure is later mirrored in code.                                                                                                                                                                                                                                           |
| Positive path plan                    | Implemented. The proofbook infrastructure now consumes the object register and validates exact proof:<ID> dossier links for every registered object/quantity. The generated object register table exposes proof-documentation status and dossier anchors; the generated proof-documentation section carries source objects, definitions, proof targets, proof sketch, verification/audit, and next action fields. |
| Module implementation manifest        | No Lean modules added. Planning/generator artifacts only: YAML master, table generator, generated object proof documentation table/export, PDF view.                                                                                                                                                                                                                                                              |
| Semantic placement decision           | Documentation infrastructure belongs in the YAML/generator layer, not scattered into phase prose or Lean modules.                                                                                                                                                                                                                                                                                                 |
| Reuse and duplication audit           | Consumes closed LEG11. The proofbook is generated from the single YAML master and existing object register; no independent proofbook file or duplicate object list is allowed.                                                                                                                                                                                                                                    |
| Canonical generator policy            | No CNNA mathematical generator introduced. The documentation generator is an artifact generator only and cannot provide mathematical input to Pillar A.                                                                                                                                                                                                                                                           |
| Module compactness rule               | A new documentation section does not imply new Lean modules. It is a generated view over object register data.                                                                                                                                                                                                                                                                                                    |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                                                                                 |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                                                                                       |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                                                                                                                                                         |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                                                                                                                                                           |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                                                                                                                                                                                                                                      |
| Governance-overhead review             | LEG12 caught and removed stale raw Proof dossier references that lacked the canonical proof:<ID> prefix, making future public-API classification checkable instead of prose-dependent.                                                                                                                                                                                                                                                                                                             |
| Proof rehearsal before implementation  | For each object: identify source objects -> state CNNA definition -> state proof goal -> cite proof-carrying code or mark missing -> verify semantic/API status -> decide documented yes/no/partial.                                                                                                                                                                                                                                                                                               |
| Expected tactics                       | No Lean tactics expected. If proof-dossier records later get mirrored in Lean, use explicit structures and exact/rfl fields; no simp-driven folding.                                                                                                                                                                                                                                                                                                                                               |
| Expected mathlib imports               | None for planning infrastructure. Object-level mathematical proofs must verify imports in their own phase.                                                                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | No ExecComplex object introduced. For ExecComplex-touching objects, the dossier must distinguish operational computable path from mirror/non-operational interpretation.                                                                                                                                                                                                                                                                                                                           |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                                                                                                                                                          |
| Bridge gap status                      | Infrastructure gap closed. Remaining no/partial proof dossiers are object-local documentation/proof gaps and must be filled at their natural correction/implementation phases; they do not block the infrastructure gate itself.                                                                                                                                                                                                                                                                   |
| Natural backjump/refactor layer        | If an object cannot be documented from its supposed sources, backjump to the earliest natural source object or blue-correction phase, not to the consumer/export layer.                                                                                                                                                                                                                                                                                                                            |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow and additionally update proof-dossier status for every object introduced, corrected, exported, or consumed as a public proof-relevant size.                                                                                                                                                                                                                                                                                             |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| How implemented                        | Closed in v42 by turning the existing proofbook view into a stricter generated infrastructure gate. scripts/generate_tables.py now validates one proof-dossier row per object ID, non-empty required dossier fields, object-register proof-documentation status, exact Proof dossier links of the form proof:<ID>, and matching object names/phases between the object register and object_proof_dossiers. The YAML master was normalized to satisfy those invariants. No Lean source was changed. |
| Verification / evidence                | python3 scripts/generate_tables.py succeeded with 189 phases, 199 objects, 189 scratch-pad records, and 199 proof-dossier records. v42 PDF compilation succeeded with pdflatex. Rendered PDF pages around the object/proof-documentation region were inspected. No new Lean build was run or claimed; the user-reported green build is the Lean baseline.                                                                                                                                          |
| Proof strategy                         | No Lean proof. Structural validation path: object register IDs -> expected proof:<ID> link -> matching object_proof_dossiers row -> generated anchor/table/export -> PDF view. Mathematical proof content remains per-object and code-checked in later natural phases.                                                                                                                                                                                                                             |
| Build result                           | Lean not run in this environment. User reported the pre-phase Lean build green; v42 generator and PDF build succeeded.                                                                                                                                                                                                                                                                                                                                                                             |
| Post-implementation plan check         | Closed. Generated object tables contain proof-documentation status and dossier links for every object or quantity; object_proof_dossiers coverage is generator-validated. Active cursor proceeds to 1.1.1.1.4 declaration classification finalization.                                                                                                                                                                                                                                             |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                     |
| Implementation notes                   | This closes only the documentation infrastructure. It does not mark all mathematical objects as proved. Dossiers with Documented=no/partial remain explicit proof/documentation obligations, and blue objects still require semantic/API correction before public-final promotion.                                                                                                                                                                                                                 |

Phase 1.1.1.1.4 – Declaration consumption classification map finalization

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                             | refactor                                                                                                                                                                                                                                                                         |
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                                          |
| Title / state                          | Declaration consumption classification map finalization                                                                                                                                                                                                                          |
| Preparation workflow                   | Use LEG10/LEG11 plus declaration/reference inventory to classify declarations and modules.                                                                                                                                                                                       |
| Source-to-CNNA mapping                 | LEG5 now closes after module-placement, reuse decisions, and proof-dossier anchors, so public API classification is not blind to code modularity or object-proof documentation.                                                                                                  |
| Dependency-depth audit                 | Depends on 1.1.1.1.1, 1.1.1.1.2, and 1.1.1.1.3. Without the proof-dossier infrastructure, classification may falsely make proof-carrying but semantically unfinished blue objects public-final.                                                                                  |
| Phase split decision                   | Renumbered from 1.1.1.1.3 to 1.1.1.1.4 because proof-documentation infrastructure must exist before final declaration/public-consumption classification.                                                                                                                         |
| Positive path plan                     | Classify declarations as core-computational, proof-bridge, public-wrapper, legacy-status, legacy-policy, phase-alias, audit-only, blue-semantic-correction, dead-candidate, or final-output, and require object-proof documentation links for public object or quantity outputs. |
| Module implementation manifest         | Consumes LEG10: the classification artifact is generated in planning tables/exports only; no new Lean module and no declaration movement.                                                                                                                                        |
| Semantic placement decision            | LEG5 remains a planning/API-hygiene artifact. Full records are generated_exports TSVs; PDF receives only the compact policy/count view.                                                                                                                                          |
| Reuse and duplication audit            | Consumes LEG11: generator-like classification is implemented as an extension of scripts/generate_tables.py, not a second inventory/export generator.                                                                                                                             |
| Canonical generator policy             | Use existing single-master table generator as the canonical seam for planning ledgers; future Lean audit mirror is optional and must not duplicate semantics.                                                                                                                    |
| Module compactness rule                | Classification operates at module/declaration/object record granularity but stores no huge declaration table in the PDF.                                                                                                                                                         |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                |
| Refactor migration metrics             | No Lean declarations migrated; import_graph_delta=none for Lean source; wrapper coexistence unchanged; generated planning artifacts only.                                                                                                                                        |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                       |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                               |
| Consumer-contract direction            | Exports generated TSVs for 1.1.1.2 blue-object correction and 1.1.1.3 public API/consumer whitelist; does not grant handoff rights.                                                                                                                                              |
| Governance-overhead review             | Useful overhead: LEG10/LEG11/LEG12 prevented a name-only classifier by forcing module placement, duplicate-policy, and proof-dossier gates before classification.                                                                                                                |
| Proof rehearsal before implementation  | Module reachability is not semantic consumption. For each class, cite direct consumer evidence, public API role, or legacy/audit reason.                                                                                                                                         |
| Expected tactics                       | No Lean tactics expected.                                                                                                                                                                                                                                                        |
| Expected mathlib imports               | None.                                                                                                                                                                                                                                                                            |
| ExecComplex/computable plan            | No ExecComplex object introduced.                                                                                                                                                                                                                                                |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                              |

|                                      |                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Computable path non-skeleton status  | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                           |
| Expected executable witness          | not specified yet                                                                                                                                                                                                                                                                                                                 |
| Mathlib complication log             | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                              |
| Noncomputable boundary audit         | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                      |
| Mathlib mitigation/refactor layer    | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                         |
| Bridge gap status                    | If an item cannot be classified, keep it out of public API and route to the natural source/correction phase.                                                                                                                                                                                                                      |
| Natural backjump/refactor layer      | Backjump to module manifest if classification depends on placement;<br>backjump to generator policy if duplicate generator semantics are detected.                                                                                                                                                                                |
| Implementation prompt contract       | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation. |
| Global no-go inheritance             | yes;<br>all <code>global_no_go_guardrails</code> inherited (GNG01-GNG24)                                                                                                                                                                                                                                                          |
| How implemented                      | Closed as v43 infrastructure/generator gate. Added a top-level <code>consumption_classification_map</code> policy, extended <code>scripts/generate_tables.py</code> to validate the exact class set, and generated module/declaration/object consumption TSV records from the frozen repo inventory and object register.          |
| Verification / evidence              | <code>scripts/generate_tables.py</code> completed on the v43 master and generated full module, declaration, and object consumption ledgers. The PDF renders the policy and aggregate counts. The generator forces B-status registered objects into blue-semantic-correction and blocks public/final promotion in this gate.       |
| Proof strategy                       | No Lean proof. Deterministic generator validation and classification evidence from repo inventory, symbol-reference summaries, sink taxonomy, object register, and proof-dossier status.                                                                                                                                          |
| Build result                         | Planning generator and PDF compilation performed in this environment;<br>prior Lean build was user-reported green. No new Lean build is claimed because no Lean source was changed.                                                                                                                                               |
| Post-implementation plan check       | After closure, advance to blue-object semantic correction ledger.                                                                                                                                                                                                                                                                 |
| Artifact packaging rule              | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                    |
| Implementation notes                 | No Lean source was moved or edited. Full declaration records live in <code>generated_exports/declaration_consumption_records.generated.tsv</code> ; the PDF intentionally renders only compact policy/count tables.                                                                                                               |

**Phase 1.1.1.1.5 – Pre-substantive-code readiness umbrella: semantic consolidation, full IST intake, neutral naming, refactor, post-scan, and release proof**

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                            | refactor                                                                                                                                                                                                                                                                                                                                  |
| Phase-type-specific contract          | Refactor phase: wrapper-first/facade-first, bounded migration package, import/declaration diff, consumer-breakage audit, and local full-build evidence before closeout.                                                                                                                                                                   |
| Title / state                         | Pre-substantive-code readiness umbrella                                                                                                                                                                                                                                                                                                   |
| Preparation workflow                  | Semantic module consolidation and compatibility-preserving refactor workflow.                                                                                                                                                                                                                                                             |
| Source-to-CNNA mapping                | This is not a mathematical CNNA object. It maps repository structure to refactor governance: only semantically identical representation layers may be consolidated; proof-producing layers remain split unless their proof/provenance information is preserved by a better canonical module.                                              |
| Dependency-depth audit                | Prerequisites closed: module manifest LEG10, reuse/generator policy LEG11, proofbook infrastructure LEG12, declaration consumption map LEG5, phase-object policy LEG21, and refactor regression protocol GNG03. Blocking item: a per-cluster ledger is not yet closed, so 1.1.1.2 is now orange rather than active.                       |
| Phase split decision                  | Create one active audit gate 1.1.1.1.5 now. Only if the ledger finds safe changes should it open bounded execution subphases, e.g. Handoff feedback wrappers, BoundarySource candidate ledgers, or notation-facade normalization. Do not split by every file family yet.                                                                  |
| Positive path plan                    | Fill LEG36 with candidate clusters: high-confidence consolidate/facade families, medium-risk schema abstractions, explicit no-merge proof-stage families, and deferred notation-facade normalization. Then either close with no Lean changes or open one small refactor execution phase with old-module facades and local build evidence. |
| Module implementation manifest        | No Lean module added now. Potential future modules, if authorized: <code>CNNA/PillarA/Handoff/Outputs/SectorExportAliases.lean</code> ; <code>CNNA/PillarA/Handoff/Inputs/FeedbackInput.lean</code> ; <code>CNNA/PillarA/Arithmetic/BoundarySource/CandidateLedgers.lean</code> . Old modules remain as facades initially.                |
| Semantic placement decision           | The audit belongs after declaration consumption classification and before blue-object content correction. This is the natural layer because it decides public/import surfaces before new semantic content is added.                                                                                                                       |
| Reuse and duplication audit           | RD08 records the consolidation decision rule. Same-semantics wrappers may be unified; proof-stage modules must remain separated until a stronger canonical proof module preserves their role.                                                                                                                                             |
| Canonical generator policy            | No generator change. If consolidation touches generated Smoke files later, it must use the existing canonical generated-source/main-path seams and must not create a second generator path.                                                                                                                                               |

|                                        |                                                                                                                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Module compactness rule                | Slim modules only when statement/provenance auditability is preserved or improved. Small clone wrappers are candidates; long proof chains are not automatically candidates; a monolithic notation facade may require splitting rather than merging.                                                                                                                   |
| Refactor regression protocol           | Mandatory before any Lean merge: retain old modules as facades in pass 1; record declarations _migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, legacy/coexistence status, and local full-build evidence.                                                                                                                                |
| Refactor migration metrics             | Not yet executed. Initial audit candidates: BoundarySource four substrate ledger clones; Handoff three A_to_{C,D,E} output aliases; Handoff four {B,C,D,E}_to_A feedback-input clones; no-merge candidates: SM generated proof chains, Cayley-Dickson S6 chain; watch item: Arithmetic/Notation monolith.                                                             |
| Lean/mathlib version policy            | Baseline remains Lean 4.28.0/mathlib snapshot. No new import may be assumed; refactor-only changes must compile locally before closeout.                                                                                                                                                                                                                              |
| ExecComplex boundary policy            | EXEC-2 remains unchanged. Consolidation may not move rational executable data behind noncomputable or analytic mirrors.                                                                                                                                                                                                                                               |
| Consumer-contract direction            | Audit flows from code producers/import surfaces to consumers. If a consumer needs a consolidated API, the facade must be created at the producer/natural source layer, not patched in the consumer.                                                                                                                                                                   |
| Governance-overhead review             | This gate is justified because concrete clone families exist, but it must remain compact: one ledger, no broad rewrite, no full code normalization before the active content path.                                                                                                                                                                                    |
| Proof rehearsal before implementation  | For each candidate cluster prove/check: same semantic operation, same or explicitly mapped public declarations, no consumer lost, import direction preserved or improved, natural generating layer chosen, old imports kept through facades, full local build green, and statement/provenance granularity not lost.                                                   |
| Expected tactics                       | If later Lean facades are created, expect explicit abbrev/def wrappers, namespace-preserving aliases, extensionality reuse where existing, and rfl proofs. Avoid tactic-heavy rewrites; no @[simp] promotion in operational path.                                                                                                                                     |
| Expected mathlib imports               | No new mathlib imports expected for audit. Any later facade/refactor should reuse existing imports; new imports require Lean 4.28.0 verification.                                                                                                                                                                                                                     |
| ExecComplex/computable plan            | No ExecComplex changes in the audit. If Arithmetic/Notation or operational modules are touched later, preserve all concrete executable witnesses and rational-boundary policy.                                                                                                                                                                                        |
| Concrete computable instance traversal | Not a computation phase. Concrete evidence is the finite repository module/declaration graph plus direct code spot-checks of named files. Later executable refactors must preserve existing executable witnesses.                                                                                                                                                     |
| Computable path non-skeleton status    | Audit-only. A later refactor may not skeletonize operational paths; it must preserve concrete generated source, DtN/Schur, determinant, and discriminant witnesses.                                                                                                                                                                                                   |
| Expected executable witness            | For audit: generated module inventory and candidate report. For later code refactor: unchanged downstream Lean build plus regenerated module/declaration inventory showing no lost public declarations unless explicitly facaded.                                                                                                                                     |
| Mathlib complication log               | No mathlib complication in audit. Later code movement may expose import-minimization issues; resolve by preserving existing import surfaces first.                                                                                                                                                                                                                    |
| Noncomputable boundary audit           | No noncomputable introduced. Later operational refactor cannot introduce noncomputable/classical pressure into executable paths.                                                                                                                                                                                                                                      |
| Mathlib mitigation/refactor layer      | If new imports are needed, prefer local facade modules or existing imported modules rather than widening mathlib dependency surface.                                                                                                                                                                                                                                  |
| Bridge gap status                      | Current bridge gap is governance-level: exact consolidation candidates are not yet fully ledgered. No mathematical bridge is missing. Do not patch consumers; place any new facade at the natural source layer of the duplicate/schema family.                                                                                                                        |
| Natural backjump/refactor layer        | BoundarySource candidate ledgers belong under Arithmetic/BoundarySource; Handoff input/output wrapper consolidation belongs under Handoff/Inputs or Outputs; notation normalization belongs at notation facade boundaries; proof-stage chains stay in their proof-stage folders unless a canonical proof module is naturally introduced.                              |
| Implementation prompt contract         | Before writing any new substantive Lean code, complete the LEG36 audit. If refactor is authorized, produce a bounded migration packet: old-module facades, changed imports, declaration delta, consumer-breakage audit, generated inventory diff, and user/local Lean build result.                                                                                   |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG26)                                                                                                                                                                                                                                                                                                              |
| How implemented                        | V1.21 delegates the active cursor to 1.1.1.1.5.1 and expands the old semantic consolidation gate into a five-step readiness chain before 1.1.1.2.                                                                                                                                                                                                                     |
| Verification / evidence                | Static repository facts: 287 Lean modules and zero missing internal import edges from repo_inventory; direct spot-checks found clone/schema families in BoundarySource substrate ledgers and Handoff input/output wrappers; long SM and Cayley-Dickson chains remain proof-stage candidates for keep/no-merge until a dedicated provenance-preservation proof exists. |
| Proof strategy                         | Refactor-governance proof by finite inventory plus targeted code inspection: identify clusters, classify safe/unsafe consolidation, require compatibility facades and regression metrics before any Lean file is moved or merged.                                                                                                                                     |
| Build result                           | No Lean build run; no Lean source changed. Python table generation and PDF compilation only.                                                                                                                                                                                                                                                                          |
| Post-implementation plan check         | After audit closure, update phase/object statuses. If no code merge is executed, return cursor to 1.1.1.2. If a refactor execution phase opens, require local full-build evidence before any new substantive code.                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with updated YAML, generated tables/exports, report, and PDF. Do not claim Lean build success unless actually run or user-reported.                                                                                                                                                                                                             |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Implementation notes                 | This phase is deliberately before 1.1.1.2. Its output is not a code merge, but a precise ledger deciding whether a later bounded Lean refactor phase is warranted. The default is no merge unless semantic equivalence, natural-layer placement, facade compatibility, and regression evidence are explicit.                                                                                                                                                                      |

### Phase 1.1.1.1.5.1 – Full IST module/declaration/object intake completeness audit before any new substantive code

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field        | Record                                                                                    |
|--------------|-------------------------------------------------------------------------------------------|

| Preparation status                     | active-prepared                                                                                                                                                                                                                                                                                                     |
| Phase type                             | refactor                                                                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Pre-substantive-code readiness/refactor gate; not a new mathematical derivation phase.                                                                                                                                                                                                                              |
| Title / state                          | Full IST module/declaration/object intake completeness audit                                                                                                                                                                                                                                                        |
| Preparation workflow                   | Semantic module consolidation and compatibility-preserving refactor workflow.                                                                                                                                                                                                                                       |
| Source-to-CNNA mapping                 | This is not a mathematical CNNA object. It maps repository structure to refactor governance: only semantically identical representation layers may be consolidated; proof-producing layers remain split unless their proof/provenance information is preserved by a better canonical module.                        |
| Dependency-depth audit                 | V1.21 identifies this phase as part of the hard pre-code readiness chain before 1.1.1.2.                                                                                                                                                                                                                            |
| Phase split decision                   | Explicit child split under 1.1.1.1.5; avoids treating a broad semantic-consolidation umbrella as sufficient proof for new content code.                                                                                                                                                                             |
| Positive path plan                     | Execute and close this gate constructively; only create obstruction/red blockers if the positive closure attempt identifies missing source/proof data.                                                                                                                                                              |
| Module implementation manifest         | No Lean module added now. Potential future modules, if authorized: CNNA/PillarA/Handoff/Outputs/SectorExportAliases.lean; CNNA/PillarA/Handoff/Inputs/FeedbackInput.lean; CNNA/PillarA/Arithmetic/BoundarySource/CandidateLedgers.lean. Old modules remain as facades initially.                                    |
| Semantic placement decision            | Natural placement is before blue-object semantic correction and any new Lean content; do not patch later consumer phases.                                                                                                                                                                                           |
| Reuse and duplication audit            | RD08 records the consolidation decision rule. Same-semantics wrappers may be unified; proof-stage modules must remain separated until a stronger canonical proof module preserves their role.                                                                                                                       |
| Canonical generator policy             | No generator change. If consolidation touches generated Smoke files later, it must use the existing canonical generated-source/main-path seams and must not create a second generator path.                                                                                                                         |
| Module compactness rule                | Preserve or improve auditability; neutralize names and consolidate only with facades/regression evidence.                                                                                                                                                                                                           |
| Refactor regression protocol           | Mandatory before any Lean merge: retain old modules as facades in pass 1; record declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, legacy/coexistence status, and local full-build evidence.                                                                               |
| Refactor migration metrics             | Not yet executed. Initial audit candidates: BoundarySource four substrate ledger clones; Handoff three A_to_{C,D,E} output aliases; Handoff four {B,C,D,E}_to_A feedback-input clones; no-merge candidates: SM generated proof chains, Cayley-Dickson S6 chain; watch item: Arithmetic/Notation monolith.           |
| Lean/mathlib version policy            | Baseline remains Lean 4.28.0/mathlib snapshot. No new import may be assumed; refactor-only changes must compile locally before closeout.                                                                                                                                                                            |
| ExecComplex boundary policy            | EXEC-2 remains unchanged. Consolidation may not move rational executable data behind noncomputable or analytic mirrors.                                                                                                                                                                                             |
| Consumer-contract direction            | Audit flows from code producers/import surfaces to consumers. If a consumer needs a consolidated API, the facade must be created at the producer/natural source layer, not patched in the consumer.                                                                                                                 |
| Governance-overhead review             | This gate is justified because concrete clone families exist, but it must remain compact: one ledger, no broad rewrite, no full code normalization before the active content path.                                                                                                                                  |
| Proof rehearsal before implementation  | For each candidate cluster prove/check: same semantic operation, same or explicitly mapped public declarations, no consumer lost, import direction preserved or improved, natural generating layer chosen, old imports kept through facades, full local build green, and statement/provenance granularity not lost. |
| Expected tactics                       | If later Lean facades are created, expect explicit abbrev/def wrappers, namespace-preserving aliases, extensionality reuse where existing, and rfl proofs. Avoid tactic-heavy rewrites; no @[simp] promotion in operational path.                                                                                   |
| Expected mathlib imports               | No new mathlib imports expected for audit. Any later facade/refactor should reuse existing imports; new imports require Lean 4.28.0 verification.                                                                                                                                                                   |
| ExecComplex/computable plan            | No ExecComplex changes in the audit. If Arithmetic/Notation or operational modules are touched later, preserve all concrete executable witnesses and rational-boundary policy.                                                                                                                                      |
| Concrete computable instance traversal | Not a computation phase. Concrete evidence is the finite repository module/declaration graph plus direct code spot-checks of named files. Later executable refactors must preserve existing executable witnesses.                                                                                                   |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Computable path non-skeleton status  | Audit-only. A later refactor may not skeletonize operational paths; it must preserve concrete generated source, DtN/Schur, determinant, and discriminant witnesses.                                                                                                                                                                                                                                                |
| Expected executable witness          | For audit: generated module inventory and candidate report. For later code refactor: unchanged downstream Lean build plus regenerated module/declaration inventory showing no lost public declarations unless explicitly facaded.                                                                                                                                                                                  |
| Mathlib complication log             | No mathlib complication in audit. Later code movement may expose import-minimization issues; resolve by preserving existing import surfaces first.                                                                                                                                                                                                                                                                 |
| Noncomputable boundary audit         | No noncomputable introduced. Later operational refactor cannot introduce noncomputable/classical pressure into executable paths.                                                                                                                                                                                                                                                                                   |
| Mathlib mitigation/refactor layer    | If new imports are needed, prefer local facade modules or existing imported modules rather than widening mathlib dependency surface.                                                                                                                                                                                                                                                                               |
| Bridge gap status                    | Current bridge gap is governance-level: exact consolidation candidates are not yet fully ledgered. No mathematical bridge is missing. Do not patch consumers; place any new facade at the natural source layer of the duplicate/schema family.                                                                                                                                                                     |
| Natural backjump/refactor layer      | BoundarySource candidate ledgers belong under Arithmetic/BoundarySource; Handoff input/output wrapper consolidation belongs under Handoff/Inputs or Outputs; notation normalization belongs at notation facade boundaries; proof-stage chains stay in their proof-stage folders unless a canonical proof module is naturally introduced.                                                                           |
| Implementation prompt contract       | Before writing any new substantive Lean code, complete the LEG36 audit. If refactor is authorized, produce a bounded migration packet: old-module facades, changed imports, declaration delta, consumer-breakage audit, generated inventory diff, and user/local Lean build result.                                                                                                                                |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG26)                                                                                                                                                                                                                                                                                                                                                        |
| How implemented                      | V1.21 planning update only: Audit every current source module/declaration/object mapping before planning code movement.                                                                                                                                                                                                                                                                                            |
| Verification / evidence              | No Lean source changed in V1.21. Closure requires exact inventory/refactor/build evidence recorded in the corresponding proof dossier and scratchpad.                                                                                                                                                                                                                                                              |
| Proof strategy                       | Close the phase by explicit references to derived-only Lean objects/proof dossiers, source inventory exports, and local build evidence where Lean refactor is executed. If proof fails, spawn upstream red blocker at natural source layer.                                                                                                                                                                        |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table/PDF generation only.                                                                                                                                                                                                                                                                                                                                    |
| Post-implementation plan check       | Do not advance to 1.1.1.2 until the complete 1.1.1.1.5.1-1.1.1.1.5.5 chain closes.                                                                                                                                                                                                                                                                                                                                 |
| Artifact packaging rule              | Return a full zip with updated YAML, exports, report and generated docs; do not claim Lean build.                                                                                                                                                                                                                                                                                                                  |
| Implementation notes                 | Audit every current source module/declaration/object mapping before planning code movement.                                                                                                                                                                                                                                                                                                                        |

### Phase 1.1.1.1.5.2 – Neutral module-name and namespace/facade migration plan

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Context class                         | LeanGovernancePhase                                                                                                                                                                                                                                                                          |
| Phase documentation tier              | F1                                                                                                                                                                                                                                                                                           |
| Phase documentation depth requirement | Extended dossier: definition, source chain, main lemmas/proof obligations, dependency risks, and downstream consumers. Enough detail for later implementation without re-reading chat history.                                                                                               |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                                                           |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                                                          |
| Implementation status                 | implementable-after-listed-predecessor                                                                                                                                                                                                                                                       |
| Preparation status                    | prepared-after-predecessor                                                                                                                                                                                                                                                                   |
| Phase type                            | refactor                                                                                                                                                                                                                                                                                     |
| Phase-type-specific contract          | Pre-substantive-code readiness/refactor gate; not a new mathematical derivation phase.                                                                                                                                                                                                       |
| Title / state                         | Neutral module-name and facade migration plan                                                                                                                                                                                                                                                |
| Preparation workflow                  | Semantic module consolidation and compatibility-preserving refactor workflow.                                                                                                                                                                                                                |
| Source-to-CNNA mapping                | This is not a mathematical CNNA object. It maps repository structure to refactor governance: only semantically identical representation layers may be consolidated; proof-producing layers remain split unless their proof/provenance information is preserved by a better canonical module. |
| Dependency-depth audit                | V1.21 identifies this phase as part of the hard pre-code readiness chain before 1.1.1.2.                                                                                                                                                                                                     |
| Phase split decision                  | Explicit child split under 1.1.1.1.5; avoids treating a broad semantic-consolidation umbrella as sufficient proof for new content code.                                                                                                                                                      |
| Positive path plan                    | Execute and close this gate constructively; only create obstruction/red blockers if the positive closure attempt identifies missing source/proof data.                                                                                                                                       |
| Module implementation manifest        | No Lean module added now. Potential future modules, if authorized: CNNA/PillarA/Handoff/Outputs/SectorExportAliases.lean; CNNA/PillarA/Handoff/Inputs/FeedbackInput.lean; CNNA/PillarA/Arithmetic/BoundarySource/CandidateLedgers.lean. Old modules remain as facades initially.             |
| Semantic placement decision           | Natural placement is before blue-object semantic correction and any new Lean content; do not patch later consumer phases.                                                                                                                                                                    |
| Reuse and duplication audit           | RD08 records the consolidation decision rule. Same-semantics wrappers may be unified; proof-stage modules must remain separated until a stronger canonical proof module preserves their role.                                                                                                |
| Canonical generator policy            | No generator change. If consolidation touches generated Smoke files later, it must use the existing canonical generated-source/main-path seams and must not create a second generator path.                                                                                                  |
| Module compactness rule               | Preserve or improve auditability; neutralize names and consolidate only with facades/regression evidence.                                                                                                                                                                                    |
| Refactor regression protocol          | Mandatory before any Lean merge: retain old modules as facades in pass 1; record declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, legacy/coexistence status, and local full-build evidence.                                                        |

|                                        |                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refactor migration metrics             | Not yet executed. Initial audit candidates: BoundarySource four substrate ledger clones; Handoff three A_to_{C,D,E} output aliases; Handoff four {B,C,D,E}_to_A feedback-input clones; no-merge candidates: SM generated proof chains, Cayley-Dickson S6 chain; watch item: Arithmetic/Notation monolith.                                |
| Lean/mathlib version policy            | Baseline remains Lean 4.28.0/mathlib snapshot. No new import may be assumed; refactor-only changes must compile locally before closeout.                                                                                                                                                                                                 |
| ExecComplex boundary policy            | EXEC-2 remains unchanged. Consolidation may not move rational executable data behind noncomputable or analytic mirrors.                                                                                                                                                                                                                  |
| Consumer-contract direction            | Audit flows from code producers/import surfaces to consumers. If a consumer needs a consolidated API, the facade must be created at the producer/natural source layer, not patched in the consumer.                                                                                                                                      |
| Governance-overhead review             | This gate is justified because concrete clone families exist, but it must remain compact: one ledger, no broad rewrite, no full code normalization before the active content path.                                                                                                                                                       |
| Proof rehearsal before implementation  | For each candidate cluster prove/check: same semantic operation, same or explicitly mapped public declarations, no consumer lost, import direction preserved or improved, natural generating layer chosen, old imports kept through facades, full local build green, and statement/provenance granularity not lost.                      |
| Expected tactics                       | If later Lean facades are created, expect explicit abbrev/def wrappers, namespace-preserving aliases, extensionality reuse where existing, and rfl proofs. Avoid tactic-heavy rewrites; no @[simp] promotion in operational path.                                                                                                        |
| Expected mathlib imports               | No new mathlib imports expected for audit. Any later facade/refactor should reuse existing imports; new imports require Lean 4.28.0 verification.                                                                                                                                                                                        |
| ExecComplex/computable plan            | No ExecComplex changes in the audit. If Arithmetic/Notation or operational modules are touched later, preserve all concrete executable witnesses and rational-boundary policy.                                                                                                                                                           |
| Concrete computable instance traversal | Not a computation phase. Concrete evidence is the finite repository module/declaration graph plus direct code spot-checks of named files. Later executable refactors must preserve existing executable witnesses.                                                                                                                        |
| Computable path non-skeleton status    | Audit-only. A later refactor may not skeletonize operational paths; it must preserve concrete generated source, DtN/Schur, determinant, and discriminant witnesses.                                                                                                                                                                      |
| Expected executable witness            | For audit: generated module inventory and candidate report. For later code refactor: unchanged downstream Lean build plus regenerated module/declaration inventory showing no lost public declarations unless explicitly facaded.                                                                                                        |
| Mathlib complication log               | No mathlib complication in audit. Later code movement may expose import-minimization issues; resolve by preserving existing import surfaces first.                                                                                                                                                                                       |
| Noncomputable boundary audit           | No noncomputable introduced. Later operational refactor cannot introduce noncomputable/classical pressure into executable paths.                                                                                                                                                                                                         |
| Mathlib mitigation/refactor layer      | If new imports are needed, prefer local facade modules or existing imported modules rather than widening mathlib dependency surface.                                                                                                                                                                                                     |
| Bridge gap status                      | Current bridge gap is governance-level: exact consolidation candidates are not yet fully ledgered. No mathematical bridge is missing. Do not patch consumers; place any new facade at the natural source layer of the duplicate/schema family.                                                                                           |
| Natural backjump/refactor layer        | BoundarySource candidate ledgers belong under Arithmetic/BoundarySource; Handoff input/output wrapper consolidation belongs under Handoff/Inputs or Outputs; notation normalization belongs at notation facade boundaries; proof-stage chains stay in their proof-stage folders unless a canonical proof module is naturally introduced. |
| Implementation prompt contract         | Before writing any new substantive Lean code, complete the LEG36 audit. If refactor is authorized, produce a bounded migration packet: old-module facades, changed imports, declaration delta, consumer-breakage audit, generated inventory diff, and user/local Lean build result.                                                      |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG26)                                                                                                                                                                                                                                                                              |
| How implemented                        | V1.21 planning update only: Plan neutral names/facades/no-merge exceptions after LEG37 closes.                                                                                                                                                                                                                                           |
| Verification / evidence                | No Lean source changed in V1.21. Closure requires exact inventory/refactor/build evidence recorded in the corresponding proof dossier and scratchpad.                                                                                                                                                                                    |
| Proof strategy                         | Close the phase by explicit references to derived-only Lean objects/proof dossiers, source inventory exports, and local build evidence where Lean refactor is executed. If proof fails, spawn upstream red blocker at natural source layer.                                                                                              |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table/PDF generation only.                                                                                                                                                                                                                                                          |
| Post-implementation plan check         | Do not advance to 1.1.1.2 until the complete 1.1.1.5.1-1.1.1.5.5 chain closes.                                                                                                                                                                                                                                                           |
| Artifact packaging rule                | Return a full zip with updated YAML, exports, report and generated docs; do not claim Lean build.                                                                                                                                                                                                                                        |
| Implementation notes                   | Plan neutral names/facades/no-merge exceptions after LEG37 closes.                                                                                                                                                                                                                                                                       |

### Phase 1.1.1.1.5.3 – Compatibility-preserving refactor execution gate for neutral module surface

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                    | prepared-after-predecessor                                                                                                                                                                                                                                                                   |
| Phase type                            | refactor                                                                                                                                                                                                                                                                                     |
| Phase-type-specific contract          | Pre-substantive-code readiness/refactor gate; not a new mathematical derivation phase.                                                                                                                                                                                                       |
| Title / state                         | Compatibility-preserving refactor execution gate                                                                                                                                                                                                                                             |
| Preparation workflow                  | Semantic module consolidation and compatibility-preserving refactor workflow.                                                                                                                                                                                                                |
| Source-to-CNNA mapping                | This is not a mathematical CNNA object. It maps repository structure to refactor governance: only semantically identical representation layers may be consolidated; proof-producing layers remain split unless their proof/provenance information is preserved by a better canonical module. |

|                                        |                                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependency-depth audit                 | V1.21 identifies this phase as part of the hard pre-code readiness chain before 1.1.1.2.                                                                                                                                                                                                                                                          |
| Phase split decision                   | Explicit child split under 1.1.1.1.5;<br>avoids treating a broad semantic-consolidation umbrella as sufficient proof for new content code.                                                                                                                                                                                                        |
| Positive path plan                     | Execute and close this gate constructively;<br>only create obstruction/red blockers if the positive closure attempt identifies missing source/proof data.                                                                                                                                                                                         |
| Module implementation manifest         | No Lean module added now. Potential future modules, if authorized: CNNA/PillarA/Handoff/Outputs/SectorExportAliases.lean;<br>CNNA/PillarA/Handoff/Inputs/FeedbackInput.lean;<br>CNNA/PillarA/Arithmetic/BoundarySource/CandidateLedgers.lean. Old modules remain as facades initially.                                                            |
| Semantic placement decision            | Natural placement is before blue-object semantic correction and any new Lean content;<br>do not patch later consumer phases.                                                                                                                                                                                                                      |
| Reuse and duplication audit            | RD08 records the consolidation decision rule. Same-semantics wrappers may be unified;<br>proof-stage modules must remain separated until a stronger canonical proof module preserves their role.                                                                                                                                                  |
| Canonical generator policy             | No generator change. If consolidation touches generated Smoke files later, it must use the existing canonical generated-source/main-path seams and must not create a second generator path.                                                                                                                                                       |
| Module compactness rule                | Preserve or improve auditability;<br>neutralize names and consolidate only with facades/regression evidence.                                                                                                                                                                                                                                      |
| Refactor regression protocol           | Mandatory before any Lean merge: retain old modules as facades in pass 1;<br>record declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, legacy/coexistence status, and local full-build evidence.                                                                                                          |
| Refactor migration metrics             | Not yet executed. Initial audit candidates: BoundarySource four substrate ledger clones;<br>Handoff three A_to_{C,D,E} output aliases;<br>Handoff four {B,C,D,E}_to_A feedback-input clones;<br>no-merge candidates: SM generated proof chains, Cayley-Dickson S6 chain;<br>watch item: Arithmetic/Notation monolith.                             |
| Lean/mathlib version policy            | Baseline remains Lean 4.28.0/mathlib snapshot. No new import may be assumed;<br>refactor-only changes must compile locally before closeout.                                                                                                                                                                                                       |
| ExecComplex boundary policy            | EXEC-2 remains unchanged. Consolidation may not move rational executable data behind noncomputable or analytic mirrors.                                                                                                                                                                                                                           |
| Consumer-contract direction            | Audit flows from code producers/import surfaces to consumers. If a consumer needs a consolidated API, the facade must be created at the producer/natural source layer, not patched in the consumer.                                                                                                                                               |
| Governance-overhead review             | This gate is justified because concrete clone families exist, but it must remain compact: one ledger, no broad rewrite, no full code normalization before the active content path.                                                                                                                                                                |
| Proof rehearsal before implementation  | For each candidate cluster prove/check: same semantic operation, same or explicitly mapped public declarations, no consumer lost, import direction preserved or improved, natural generating layer chosen, old imports kept through facades, full local build green, and statement/provenance granularity not lost.                               |
| Expected tactics                       | If later Lean facades are created, expect explicit abbrev/def wrappers, namespace-preserving aliases, extensionality reuse where existing, and rfl proofs. Avoid tactic-heavy rewrites;<br>no @[simp] promotion in operational path.                                                                                                              |
| Expected mathlib imports               | No new mathlib imports expected for audit. Any later facade/refactor should reuse existing imports;<br>new imports require Lean 4.28.0 verification.                                                                                                                                                                                              |
| ExecComplex/computable plan            | No ExecComplex changes in the audit. If Arithmetic/Notation or operational modules are touched later, preserve all concrete executable witnesses and rational-boundary policy.                                                                                                                                                                    |
| Concrete computable instance traversal | Not a computation phase. Concrete evidence is the finite repository module/declaration graph plus direct code spot-checks of named files. Later executable refactors must preserve existing executable witnesses.                                                                                                                                 |
| Computable path non-skeleton status    | Audit-only. A later refactor may not skeletonize operational paths;<br>it must preserve concrete generated source, DtN/Schur, determinant, and discriminant witnesses.                                                                                                                                                                            |
| Expected executable witness            | For audit: generated module inventory and candidate report. For later code refactor: unchanged downstream Lean build plus regenerated module/declaration inventory showing no lost public declarations unless explicitly facaded.                                                                                                                 |
| Mathlib complication log               | No mathlib complication in audit. Later code movement may expose import-minimization issues;<br>resolve by preserving existing import surfaces first.                                                                                                                                                                                             |
| Noncomputable boundary audit           | No noncomputable introduced. Later operational refactor cannot introduce noncomputable/classical pressure into executable paths.                                                                                                                                                                                                                  |
| Mathlib mitigation/refactor layer      | If new imports are needed, prefer local facade modules or existing imported modules rather than widening mathlib dependency surface.                                                                                                                                                                                                              |
| Bridge gap status                      | Current bridge gap is governance-level: exact consolidation candidates are not yet fully ledgered. No mathematical bridge is missing. Do not patch consumers;<br>place any new facade at the natural source layer of the duplicate/schema family.                                                                                                 |
| Natural backjump/refactor layer        | BoundarySource candidate ledgers belong under Arithmetic/BoundarySource;<br>Handoff input/output wrapper consolidation belongs under Handoff/Inputs or Outputs;<br>notation normalization belongs at notation facade boundaries;<br>proof-stage chains stay in their proof-stage folders unless a canonical proof module is naturally introduced. |
| Implementation prompt contract         | Before writing any new substantive Lean code, complete the LEG36 audit. If refactor is authorized, produce a bounded migration packet: old-module facades, changed imports, declaration delta, consumer-breakage audit, generated inventory diff, and user/local Lean build result.                                                               |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|

### Phase 1.1.1.1.5.4 – Post-refactor inventory re-scan and IST-object/proof-dossier reclassification

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                  | implementable-after-listed-predecessor                                                                                                                                                                                                                                                                              |
| Preparation status                     | prepared-after-predecessor                                                                                                                                                                                                                                                                                          |
| Phase type                             | refactor                                                                                                                                                                                                                                                                                                            |
| Phase-type-specific contract           | Pre-substantive-code readiness/refactor gate; not a new mathematical derivation phase.                                                                                                                                                                                                                              |
| Title / state                          | Post-refactor inventory re-scan and reclassification                                                                                                                                                                                                                                                                |
| Preparation workflow                   | Semantic module consolidation and compatibility-preserving refactor workflow.                                                                                                                                                                                                                                       |
| Source-to-CNNA mapping                 | This is not a mathematical CNNA object. It maps repository structure to refactor governance: only semantically identical representation layers may be consolidated; proof-producing layers remain split unless their proof/provenance information is preserved by a better canonical module.                        |
| Dependency-depth audit                 | V1.21 identifies this phase as part of the hard pre-code readiness chain before 1.1.1.2.                                                                                                                                                                                                                            |
| Phase split decision                   | Explicit child split under 1.1.1.1.5; avoids treating a broad semantic-consolidation umbrella as sufficient proof for new content code.                                                                                                                                                                             |
| Positive path plan                     | Execute and close this gate constructively; only create obstruction/red blockers if the positive closure attempt identifies missing source/proof data.                                                                                                                                                              |
| Module implementation manifest         | No Lean module added now. Potential future modules, if authorized: CNNA/PillarA/Handoff/Outputs/SectorExportAliases.lean; CNNA/PillarA/Handoff/Inputs/FeedbackInput.lean; CNNA/PillarA/Arithmetic/BoundarySource/CandidateLedgers.lean. Old modules remain as facades initially.                                    |
| Semantic placement decision            | Natural placement is before blue-object semantic correction and any new Lean content; do not patch later consumer phases.                                                                                                                                                                                           |
| Reuse and duplication audit            | RD08 records the consolidation decision rule. Same-semantics wrappers may be unified; proof-stage modules must remain separated until a stronger canonical proof module preserves their role.                                                                                                                       |
| Canonical generator policy             | No generator change. If consolidation touches generated Smoke files later, it must use the existing canonical generated-source/main-path seams and must not create a second generator path.                                                                                                                         |
| Module compactness rule                | Preserve or improve auditability; neutralize names and consolidate only with facades/regression evidence.                                                                                                                                                                                                           |
| Refactor regression protocol           | Mandatory before any Lean merge: retain old modules as facades in pass 1; record declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, legacy/coexistence status, and local full-build evidence.                                                                               |
| Refactor migration metrics             | Not yet executed. Initial audit candidates: BoundarySource four substrate ledger clones; Handoff three A_to_{C,D,E} output aliases; Handoff four {B,C,D,E}_to_A feedback-input clones; no-merge candidates: SM generated proof chains, Cayley-Dickson S6 chain; watch item: Arithmetic/Notation monolith.           |
| Lean/mathlib version policy            | Baseline remains Lean 4.28.0/mathlib snapshot. No new import may be assumed; refactor-only changes must compile locally before closeout.                                                                                                                                                                            |
| ExecComplex boundary policy            | EXEC-2 remains unchanged. Consolidation may not move rational executable data behind noncomputable or analytic mirrors.                                                                                                                                                                                             |
| Consumer-contract direction            | Audit flows from code producers/import surfaces to consumers. If a consumer needs a consolidated API, the facade must be created at the producer/natural source layer, not patched in the consumer.                                                                                                                 |
| Governance-overhead review             | This gate is justified because concrete clone families exist, but it must remain compact: one ledger, no broad rewrite, no full code normalization before the active content path.                                                                                                                                  |
| Proof rehearsal before implementation  | For each candidate cluster prove/check: same semantic operation, same or explicitly mapped public declarations, no consumer lost, import direction preserved or improved, natural generating layer chosen, old imports kept through facades, full local build green, and statement/provenance granularity not lost. |
| Expected tactics                       | If later Lean facades are created, expect explicit abbrev/def wrappers, namespace-preserving aliases, extensionality reuse where existing, and rfl proofs. Avoid tactic-heavy rewrites; no @[simp] promotion in operational path.                                                                                   |
| Expected mathlib imports               | No new mathlib imports expected for audit. Any later facade/refactor should reuse existing imports; new imports require Lean 4.28.0 verification.                                                                                                                                                                   |
| ExecComplex/computable plan            | No ExecComplex changes in the audit. If Arithmetic/Notation or operational modules are touched later, preserve all concrete executable witnesses and rational-boundary policy.                                                                                                                                      |
| Concrete computable instance traversal | Not a computation phase. Concrete evidence is the finite repository module/declaration graph plus direct code spot-checks of named files. Later executable refactors must preserve existing executable witnesses.                                                                                                   |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                    |
|--------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Computable path non-skeleton status  | Audit-only. A later refactor may not skeletonize operational paths; it must preserve concrete generated source, DtN/Schur, determinant, and discriminant witnesses.                                                                                                                                                                                                                                                |
| Expected executable witness          | For audit: generated module inventory and candidate report. For later code refactor: unchanged downstream Lean build plus regenerated module/declaration inventory showing no lost public declarations unless explicitly facaded.                                                                                                                                                                                  |
| Mathlib complication log             | No mathlib complication in audit. Later code movement may expose import-minimization issues; resolve by preserving existing import surfaces first.                                                                                                                                                                                                                                                                 |
| Noncomputable boundary audit         | No noncomputable introduced. Later operational refactor cannot introduce noncomputable/classical pressure into executable paths.                                                                                                                                                                                                                                                                                   |
| Mathlib mitigation/refactor layer    | If new imports are needed, prefer local facade modules or existing imported modules rather than widening mathlib dependency surface.                                                                                                                                                                                                                                                                               |
| Bridge gap status                    | Current bridge gap is governance-level: exact consolidation candidates are not yet fully ledgered. No mathematical bridge is missing. Do not patch consumers; place any new facade at the natural source layer of the duplicate/schema family.                                                                                                                                                                     |
| Natural backjump/refactor layer      | BoundarySource candidate ledgers belong under Arithmetic/BoundarySource; Handoff input/output wrapper consolidation belongs under Handoff/Inputs or Outputs; notation normalization belongs at notation facade boundaries; proof-stage chains stay in their proof-stage folders unless a canonical proof module is naturally introduced.                                                                           |
| Implementation prompt contract       | Before writing any new substantive Lean code, complete the LEG36 audit. If refactor is authorized, produce a bounded migration packet: old-module facades, changed imports, declaration delta, consumer-breakage audit, generated inventory diff, and user/local Lean build result.                                                                                                                                |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG26)                                                                                                                                                                                                                                                                                                                                                        |
| How implemented                      | V1.21 planning update only: Regenerate and reconcile module/declaration/object/proof inventory after refactor.                                                                                                                                                                                                                                                                                                     |
| Verification / evidence              | No Lean source changed in V1.21. Closure requires exact inventory/refactor/build evidence recorded in the corresponding proof dossier and scratchpad.                                                                                                                                                                                                                                                              |
| Proof strategy                       | Close the phase by explicit references to derived-only Lean objects/proof dossiers, source inventory exports, and local build evidence where Lean refactor is executed. If proof fails, spawn upstream red blocker at natural source layer.                                                                                                                                                                        |
| Build result                         | No Lean build run;<br>no Lean source changed. Python table/PDF generation only.                                                                                                                                                                                                                                                                                                                                    |
| Post-implementation plan check       | Do not advance to 1.1.1.2 until the complete 1.1.1.1.5.1-1.1.1.1.5.5 chain closes.                                                                                                                                                                                                                                                                                                                                 |
| Artifact packaging rule              | Return a full zip with updated YAML, exports, report and generated docs; do not claim Lean build.                                                                                                                                                                                                                                                                                                                  |
| Implementation notes                 | Regenerate and reconcile module/declaration/object/proof inventory after refactor.                                                                                                                                                                                                                                                                                                                                 |

### Phase 1.1.1.1.5.5 – Pre-substantive-code release certificate for 1.1.1.2 and later Lean content phases

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                    | prepared-after-predecessor                                                                                                                                                                                                                                                                   |
| Phase type                            | refactor                                                                                                                                                                                                                                                                                     |
| Phase-type-specific contract          | Pre-substantive-code readiness/refactor gate; not a new mathematical derivation phase.                                                                                                                                                                                                       |
| Title / state                         | Pre-substantive-code release certificate                                                                                                                                                                                                                                                     |
| Preparation workflow                  | Semantic module consolidation and compatibility-preserving refactor workflow.                                                                                                                                                                                                                |
| Source-to-CNNA mapping                | This is not a mathematical CNNA object. It maps repository structure to refactor governance: only semantically identical representation layers may be consolidated; proof-producing layers remain split unless their proof/provenance information is preserved by a better canonical module. |
| Dependency-depth audit                | V1.21 identifies this phase as part of the hard pre-code readiness chain before 1.1.1.2.                                                                                                                                                                                                     |
| Phase split decision                  | Explicit child split under 1.1.1.1.5; avoids treating a broad semantic-consolidation umbrella as sufficient proof for new content code.                                                                                                                                                      |
| Positive path plan                    | Execute and close this gate constructively; only create obstruction/red blockers if the positive closure attempt identifies missing source/proof data.                                                                                                                                       |
| Module implementation manifest        | No Lean module added now. Potential future modules, if authorized: CNNA/PillarA/Handoff/Outputs/SectorExportAliases.lean; CNNA/PillarA/Handoff/Inputs/FeedbackInput.lean; CNNA/PillarA/Arithmetic/BoundarySource/CandidateLedgers.lean. Old modules remain as facades initially.             |
| Semantic placement decision           | Natural placement is before blue-object semantic correction and any new Lean content; do not patch later consumer phases.                                                                                                                                                                    |
| Reuse and duplication audit           | RD08 records the consolidation decision rule. Same-semantics wrappers may be unified; proof-stage modules must remain separated until a stronger canonical proof module preserves their role.                                                                                                |
| Canonical generator policy            | No generator change. If consolidation touches generated Smoke files later, it must use the existing canonical generated-source/main-path seams and must not create a second generator path.                                                                                                  |
| Module compactness rule               | Preserve or improve auditability; neutralize names and consolidate only with facades/regression evidence.                                                                                                                                                                                    |
| Refactor regression protocol          | Mandatory before any Lean merge: retain old modules as facades in pass 1; record declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, legacy/coexistence status, and local full-build evidence.                                                        |

|                                        |                                                                                                                                                                                                                                                                                                                                          |
|----------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refactor migration metrics             | Not yet executed. Initial audit candidates: BoundarySource four substrate ledger clones; Handoff three A_to_{C,D,E} output aliases; Handoff four {B,C,D,E}_to_A feedback-input clones; no-merge candidates: SM generated proof chains, Cayley-Dickson S6 chain; watch item: Arithmetic/Notation monolith.                                |
| Lean/mathlib version policy            | Baseline remains Lean 4.28.0/mathlib snapshot. No new import may be assumed; refactor-only changes must compile locally before closeout.                                                                                                                                                                                                 |
| ExecComplex boundary policy            | EXEC-2 remains unchanged. Consolidation may not move rational executable data behind noncomputable or analytic mirrors.                                                                                                                                                                                                                  |
| Consumer-contract direction            | Audit flows from code producers/import surfaces to consumers. If a consumer needs a consolidated API, the facade must be created at the producer/natural source layer, not patched in the consumer.                                                                                                                                      |
| Governance-overhead review             | This gate is justified because concrete clone families exist, but it must remain compact: one ledger, no broad rewrite, no full code normalization before the active content path.                                                                                                                                                       |
| Proof rehearsal before implementation  | For each candidate cluster prove/check: same semantic operation, same or explicitly mapped public declarations, no consumer lost, import direction preserved or improved, natural generating layer chosen, old imports kept through facades, full local build green, and statement/provenance granularity not lost.                      |
| Expected tactics                       | If later Lean facades are created, expect explicit abbrev/def wrappers, namespace-preserving aliases, extensionality reuse where existing, and rfl proofs. Avoid tactic-heavy rewrites; no @[simp] promotion in operational path.                                                                                                        |
| Expected mathlib imports               | No new mathlib imports expected for audit. Any later facade/refactor should reuse existing imports; new imports require Lean 4.28.0 verification.                                                                                                                                                                                        |
| ExecComplex/computable plan            | No ExecComplex changes in the audit. If Arithmetic/Notation or operational modules are touched later, preserve all concrete executable witnesses and rational-boundary policy.                                                                                                                                                           |
| Concrete computable instance traversal | Not a computation phase. Concrete evidence is the finite repository module/declaration graph plus direct code spot-checks of named files. Later executable refactors must preserve existing executable witnesses.                                                                                                                        |
| Computable path non-skeleton status    | Audit-only. A later refactor may not skeletonize operational paths; it must preserve concrete generated source, DtN/Schur, determinant, and discriminant witnesses.                                                                                                                                                                      |
| Expected executable witness            | For audit: generated module inventory and candidate report. For later code refactor: unchanged downstream Lean build plus regenerated module/declaration inventory showing no lost public declarations unless explicitly facaded.                                                                                                        |
| Mathlib complication log               | No mathlib complication in audit. Later code movement may expose import-minimization issues; resolve by preserving existing import surfaces first.                                                                                                                                                                                       |
| Noncomputable boundary audit           | No noncomputable introduced. Later operational refactor cannot introduce noncomputable/classical pressure into executable paths.                                                                                                                                                                                                         |
| Mathlib mitigation/refactor layer      | If new imports are needed, prefer local facade modules or existing imported modules rather than widening mathlib dependency surface.                                                                                                                                                                                                     |
| Bridge gap status                      | Current bridge gap is governance-level: exact consolidation candidates are not yet fully ledgered. No mathematical bridge is missing. Do not patch consumers; place any new facade at the natural source layer of the duplicate/schema family.                                                                                           |
| Natural backjump/refactor layer        | BoundarySource candidate ledgers belong under Arithmetic/BoundarySource; Handoff input/output wrapper consolidation belongs under Handoff/Inputs or Outputs; notation normalization belongs at notation facade boundaries; proof-stage chains stay in their proof-stage folders unless a canonical proof module is naturally introduced. |
| Implementation prompt contract         | Before writing any new substantive Lean code, complete the LEG36 audit. If refactor is authorized, produce a bounded migration packet: old-module facades, changed imports, declaration delta, consumer-breakage audit, generated inventory diff, and user/local Lean build result.                                                      |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG26)                                                                                                                                                                                                                                                                              |
| How implemented                        | V1.21 planning update only: Release 1.1.1.2 only after LEG37-LEG40 and proof-dossier updates close.                                                                                                                                                                                                                                      |
| Verification / evidence                | No Lean source changed in V1.21. Closure requires exact inventory/refactor/build evidence recorded in the corresponding proof dossier and scratchpad.                                                                                                                                                                                    |
| Proof strategy                         | Close the phase by explicit references to derived-only Lean objects/proof dossiers, source inventory exports, and local build evidence where Lean refactor is executed. If proof fails, spawn upstream red blocker at natural source layer.                                                                                              |
| Build result                           | No Lean build run;<br>no Lean source changed. Python table/PDF generation only.                                                                                                                                                                                                                                                          |
| Post-implementation plan check         | Do not advance to 1.1.1.2 until the complete 1.1.1.5.1-1.1.1.5.5 chain closes.                                                                                                                                                                                                                                                           |
| Artifact packaging rule                | Return a full zip with updated YAML, exports, report and generated docs; do not claim Lean build.                                                                                                                                                                                                                                        |
| Implementation notes                   | Release 1.1.1.2 only after LEG37-LEG40 and proof-dossier updates close.                                                                                                                                                                                                                                                                  |

### Phase 1.1.1.2 – Blue-object semantic correction ledger

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                   |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #fce4d6;">O</span>                                                                                                                        |
| Context class                         | LeanGovernancePhase                                                                                                                                                      |
| Phase documentation tier              | F3                                                                                                                                                                       |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                       |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                      |
| Implementation status                 | prepared-after-pre-code-readiness-chain                                                                                                                                  |
| Preparation status                    | active-prepared                                                                                                                                                          |
| Phase type                            | refactor                                                                                                                                                                 |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.  |
| Title / state                         | Blue-object semantic correction ledger after semantic module consolidation gate                                                                                          |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries. |
| Source-to-CNNA mapping                | LEG7 maps every B object to its correction phase and public-neutral API. The B object remains proof-carrying but semantically quarantined until corrected.               |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Dependency-depth audit                 | Now depends on 1.1.1.1.5.5 and closed LEG37-LEG41 readiness chain before activation. Now additionally depends on closure of 1.1.1.1.5 semantic module consolidation audit before activation. Feasible as infrastructure-only after v43/v44: LEG5 declaration/object consumption classification, LEG12 proof-dossier anchors, LEG10 module manifest, and LEG11 reuse policy are closed. Blocking dependency for code changes: if a blue object lacks a dossier/code-site/source object, backjump to object-proof documentation or consumption classification rather than patching LEG7. |
| Phase split decision                   | Do not split before the first LEG7 ledger generation. Split only if the generated B-object list shows distinct correction families requiring separate natural phases, e.g. Cayley-Dickson, Schur/DtN, and operational arithmetic.                                                                                                                                                                                                                                                                                                                                                      |
| Positive path plan                     | Positive path: generate/validate the LEG7 ledger for all B objects from existing object register, proof dossiers, and object_consumption_classification export; record semantic/API defect, allowed temporary consumers, forbidden direct/public consumers, correction phase, and exit-to-white condition for each row.                                                                                                                                                                                                                                                                |
| Module implementation manifest         | Infrastructure/planning gate expected. Use existing YAML/generator tables unless a code phase proves a Lean audit mirror is necessary.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Semantic placement decision            | The ledger belongs in the planning master/generated tables first. It must not patch consumers or move Lean declarations before the correction semantics are recorded.                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Reuse and duplication audit            | Consume LEG11 and LEG5;<br>do not create a parallel object-status or classifier generator.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Canonical generator policy             | Extend scripts/generate_tables.py if generated views are needed;<br>otherwise keep the blue correction ledger in YAML as a governance source.                                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Module compactness rule                | Classify by object family and correction phase. Do not generate one prose subsection per Lean declaration unless a correction really depends on it.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                                                                                                                                                                                                                                                                      |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                                                                                                                                                                                                                                                                            |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                                                                                                                                                                                                                                                             |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                                                                                                                                                                                                                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                                                                                                                                                                                                                                                                                                                          |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Proof rehearsal before implementation  | Infrastructure proof rehearsal: each blue object must satisfy B-status -> blue-semantic-correction class -> has proof dossier -> has current derivation site -> has forbidden public consumers -> has natural correction phase -> has exit-to-white condition. Failure localizes to dossier/classification source, not to public API/pruning consumers.                                                                                                                                                                                                                                |
| Expected tactics                       | No Lean proof tactics expected unless a small audit module is introduced. For such modules, prefer explicit records and exact/rfl proofs only.                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Expected mathlib imports               | No new mathlib imports expected;<br>if a later Lean audit file is introduced, verify imports against mathlib 4.28.0 first.                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Expected executable witness            | Not required for this infrastructure-only ledger phase;<br>the witness is generated TSV/TeX consistency over existing object/proof/classification records. If Lean code is proposed, a separate finite executable witness must be named before implementation.                                                                                                                                                                                                                                                                                                                         |
| Mathlib complication log               | No mathlib complication expected for ledger-only implementation;<br>no new Lean/mathlib import should be introduced. Any proposed Lean audit file must verify imports against Lean 4.28.0 before code starts.                                                                                                                                                                                                                                                                                                                                                                          |
| Noncomputable boundary audit           | No operational or mirror mathematical code is introduced in the planned ledger-only route;<br>noncomputable/classical pressure would indicate that the phase has drifted into a later mathematical correction phase.                                                                                                                                                                                                                                                                                                                                                                   |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Bridge gap status                      | No mathematical bridge should be invented here. Current known open item SCF26 is a ledger-completeness requirement for 1.1.1.2, not a request for new mathematics.                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                                                                                                                                                                                                                                                                                                                                                                               |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation.                                                                                                                                                                                                                                                      |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| How implemented                        | Not completed and no longer the active cursor in V1.12. It becomes implementable in the derivation chain after Phase 1.1.1.1.5 closes.                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Verification / evidence                | Feasibility remains valid from v44, but V1.12 inserted a pre-substantive semantic module consolidation gate because code inspection found clone/schema module families that should be audited before new content code.                                                                                                                                                                                                                                                                                                                                                                 |
| Post-implementation plan check         | After closure, update linked objects, generated exports/PDF, and advance exactly one active cursor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

Phase 1.1.1.3 – Public API contract and consumer whitelist

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                    |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #fff2cc;">W</span>                                                                                         |
| Context class                         | LeanGovernancePhase                                                                                                                       |
| Phase documentation tier              | F3                                                                                                                                        |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat. |
| Record change version                 | unchanged-by-V1.01                                                                                                                        |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                       |
| Implementation status                 | planned-not-active                                                                                                                        |
| Preparation status                    | planned-not-active                                                                                                                        |

|                                        |                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase type                             | refactor                                                                                                                                                                                                                                                                                                                          |
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                                                                                           |
| Title / state                          | Public API contract and consumer whitelist                                                                                                                                                                                                                                                                                        |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.                                                                                                                                                          |
| Source-to-CNNA mapping                 | LEG6/LEG9 define which modules and declarations may be seen by Phase 3+ and later handoffs.                                                                                                                                                                                                                                       |
| Dependency-depth audit                 | Depends on module manifest, reuse audit, proof-dossier infrastructure, declaration classification, and blue correction. Public API exposure is invalid if any public object lacks a proof-dossier link or is still blue/semantically unfinished.                                                                                  |
| Phase split decision                   | Atomic contract phase; movement happens only in 1.1.2-1.1.5.                                                                                                                                                                                                                                                                      |
| Positive path plan                     | Declare the visible post-cleanup API and consumer whitelist. Exclude Legacy.StatusGates, phase aliases, audit-only material, duplicate generator seams, uncorrected blue objects, and any public object without proof-documentation status.                                                                                       |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                 |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                       |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                        |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                               |
| Proof rehearsal before implementation  | Verify every downstream phase consumes either a white/yellow planned object or a corrected neutral wrapper, never status/audit/phase aliases.                                                                                                                                                                                     |
| Expected tactics                       | No Lean proof tactics expected unless a small audit module is introduced. For such modules, prefer explicit records and exact/rfl proofs only.                                                                                                                                                                                    |
| Expected mathlib imports               | No new mathlib imports expected; if a later Lean audit file is introduced, verify imports against mathlib 4.28.0 first.                                                                                                                                                                                                           |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                                                                                                                            |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                               |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                                                                              |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                 |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                              |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                      |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                         |
| Bridge gap status                      | No mathematical bridge should be invented here. If a blue object needs mathematics, route it to its natural correction phase.                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                                                                                                                          |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation. |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                          |
| How implemented                        | No completed implementation record yet. This phase is planned by v23 and must remain inactive until its predecessor gate closes.                                                                                                                                                                                                  |
| Verification / evidence                | Not applicable yet; this is a planning/preparation gate until it becomes the unique active phase.                                                                                                                                                                                                                                 |
| Post-implementation plan check         | After closure, update linked objects, generated exports/PDF, and advance exactly one active cursor.                                                                                                                                                                                                                               |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                    |
| Implementation notes                   | Do not implement by broad deletion. First produce the specified ledger/contract and update generated views.                                                                                                                                                                                                                       |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Phase 1.1.1.4 – Pruning and dead-candidate ledger before deletion

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                               |
|---------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                    |
| Context class                         | LeanGovernancePhase                                                                                                                                                                  |
| Phase documentation tier              | F3                                                                                                                                                                                   |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                            |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                   |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                  |
| Implementation status                 | planned-not-active                                                                                                                                                                   |
| Preparation status                    | planned-not-active                                                                                                                                                                   |
| Phase type                            | refactor                                                                                                                                                                             |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.              |
| Title / state                         | Pruning and dead-candidate ledger before deletion                                                                                                                                    |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.             |
| Source-to-CNNA mapping                | LEG8 records pruning classes. Deletion is explicitly deferred to a later implementation phase after build evidence.                                                                  |
| Dependency-depth audit                | Depends on public API contract, declaration classification, and proof-dossier infrastructure; pruning may not delete objects needed for documentation, audit, or proof-bridge roles. |
| Phase split decision                  | Atomic ledger phase; actual deletion remains prohibited here.                                                                                                                        |
| Positive path plan                    | Classify conservatively; keep proof bridges and legacy audit records unless a later green-build removal confirms deletion safety.                                                    |

|                                        |                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                                                                 |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                                                       |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                        |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                          |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                                                                     |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                               |
| Proof rehearsal before implementation  | A declaration can be deletion-candidate only if it has no public contract, proof bridge, legacy audit role, or blue-correction role.                                                                                                                                                                                              |
| Expected tactics                       | No Lean proof tactics expected unless a small audit module is introduced. For such modules, prefer explicit records and exact/rfl proofs only.                                                                                                                                                                                    |
| Expected mathlib imports               | No new mathlib imports expected; if a later Lean audit file is introduced, verify imports against mathlib 4.28.0 first.                                                                                                                                                                                                           |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                                                                                                                            |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                               |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                                                                              |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                                                                 |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                                                              |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                                                                      |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                         |
| Bridge gap status                      | No mathematical bridge should be invented here. If a blue object needs mathematics, route it to its natural correction phase.                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                                                                                                                          |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation. |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                          |
| How implemented                        | No completed implementation record yet. This phase is planned by v23 and must remain inactive until its predecessor gate closes.                                                                                                                                                                                                  |
| Verification / evidence                | Not applicable yet; this is a planning/preparation gate until it becomes the unique active phase.                                                                                                                                                                                                                                 |
| Post-implementation plan check         | After closure, update linked objects, generated exports/PDF, and advance exactly one active cursor.                                                                                                                                                                                                                               |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                    |
| Implementation notes                   | Do not implement by broad deletion. First produce the specified ledger/contract and update generated views.                                                                                                                                                                                                                       |

### Phase 1.1.1.5 – Generated-view authority and inventory lock for implementation prompts

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
 Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                      |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                                                           |
| Context class                         | LeanGovernancePhase                                                                                                                                                                                                         |
| Phase documentation tier              | F3                                                                                                                                                                                                                          |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                                   |

| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                     |
| Title / state                         | Generated-view authority and inventory lock                                                                                                                                                                                 |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.                                                    |
| Source-to-CNNA mapping                | Locks the planning artifact so 1.1.2 can be implemented from the classification contracts.                                                                                                                                  |
| Dependency-depth audit                | Depends on all previous child gates and generated table/PDF validation.                                                                                                                                                     |
| Phase split decision                  | No split needed unless generated report and PDF authority diverge.                                                                                                                                                          |
| Positive path plan                    | Regenerate tables/PDF/report and set next active cursor to 1.1.2 only after module manifest, reuse/generator audit, declaration classification, blue correction ledger, public API contract, and pruning ledger are closed. |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                           |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                 |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.  |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                    |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                               |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                         |
| Proof rehearsal before implementation | Validate single YAML source, no stale masters, exactly one active phase, all scratchpad records complete, PDF renders.                                                                                                      |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 1.1.1.5.1 – Tool-mode split and lean-focus contract

**Table legend.**   **G** = green/closed and derived-only;   **W** = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   **O** = orange/implementable after stated predecessor closure;   **Y** = yellow/active and implementable now;   **R** = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase type                             | infrastructure                                                                                                                                                                                                             |
| Phase-type-specific contract           | Infrastructure phase: update YAML/generator/generated exports, validate single-source constraints, and render PDF without claiming Lean build success.                                                                     |
| Title / state                          | Tool-mode split and lean-focus contract                                                                                                                                                                                    |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.                                                   |
| Source-to-CNNA mapping                 | No theory classification yet; this phase only fixes the mode boundary.                                                                                                                                                     |
| Dependency-depth audit                 | Depends on 1.1.1.5 and earlier governance gates. It must not block the current active 1.1.1.2 blue-correction ledger; it is a future scaling/tooling refinement.                                                           |
| Phase split decision                   | Atomic planned subphase under 1.1.1.5. Split only if implementation would otherwise mix Lean-code changes with tool/PDF/YAML changes.                                                                                      |
| Positive path plan                     | Implement by extending Python/YAML/generated exports first. Do not add Lean code. If a Lean-side audit mirror becomes necessary, create a separate later Lean phase with an explicit finite witness and import policy.     |
| Module implementation manifest         | Tooling subphase. Proposed generated artifacts: workflow-policy row; scaling-plan TSV/TeX; no Lean code                                                                                                                    |
| Semantic placement decision            | Belongs under 1.1.1.5 generated-view authority/implementation-lock tooling. It must not patch mathematical consumers.                                                                                                      |
| Reuse and duplication audit            | Reuse existing single YAML master and scripts/generate_tables.py. Avoid parallel masters or a second manually maintained planning source.                                                                                  |
| Canonical generator policy             | Extend the existing Python generator in the smallest possible way; exports are generated TSV/JSON/TeX, not manually edited tables.                                                                                         |
| Module compactness rule                | Keep PDF slices compact; full data remains in generated TSV/JSON exports.                                                                                                                                                  |
| Refactor regression protocol           | Not a Lean refactor. If Python generator is changed, run generator validation and render-check the affected PDF sections.                                                                                                  |
| Refactor migration metrics             | No Lean declaration migration. Record generator/export changes only when the phase becomes active.                                                                                                                         |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                         |
| Consumer-contract direction            | Future Lean phases may consume only compact implementation packets and the relevant ledger slices, not broad manual PDF scans.                                                                                             |
| Governance-overhead review             | This phase exists to reduce governance overhead during Lean work by pushing routine collection/rendering into Python.                                                                                                      |
| Proof rehearsal before implementation  | Validate generator output, single YAML source, exactly one active phase, unchanged Lean-data timestamp, and section-specific rendering. This is a tooling proof rehearsal, not a Lean theorem.                             |
| Expected tactics                       | No Lean tactics expected. If a later Lean mirror is explicitly introduced, use explicit records/constructors and avoid @[simp], noncomputable operational paths, classical helpers, and broad fragile rewrites.            |
| Expected mathlib imports               | No new mathlib imports expected for the planned Python/YAML tooling route.                                                                                                                                                 |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                     |
| Concrete computable instance traversal | Not an operational Lean phase. The concrete tooling witness is generated exports and PDF rendering over the current single YAML master.                                                                                    |
| Computable path non-skeleton status    | not-applicable-tooling-only; no operational mathematical computation is introduced                                                                                                                                         |
| Expected executable witness            | Python generator run plus generated TSV/TeX/PDF artifacts; no Lean executable witness required.                                                                                                                            |
| Mathlib complication log               | No mathlib complication expected because this is a Python/YAML/PDF tooling phase.                                                                                                                                          |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
|--------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Noncomputable boundary audit         | No Lean operational path is modified;<br>any noncomputable/classical concern indicates accidental drift into Lean code and requires a separate phase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Mathlib mitigation/refactor layer    | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
| Bridge gap status                    | No mathematical bridge is introduced here. Local background theory and large end-theory comparison roles are tracked as metadata/ledgers, not as CNNA generators.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Natural backjump/refactor layer      | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Implementation prompt contract       | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |

| Post-implementation plan check       | After closure, update linked objects, generated exports/PDF, and advance exactly one active cursor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Artifact packaging rule              | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |
| Implementation notes                 | Define audit-full, phase-check, and lean-focus modes so routine Lean work consumes compact implementation packets instead of full PDF/table scans. Full PDF regeneration is not part of ordinary Lean coding; use compact packets unless a governance or audit phase explicitly requests audit-full.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Phase 1.1.1.5.2 – Implementation Packet Generator

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                     |

| Implementation status                 | planned-not-active                                                                                                                                                                                                         |
| Preparation status                    | planned-not-active                                                                                                                                                                                                         |
| Phase type                            | infrastructure                                                                                                                                                                                                             |
| Phase-type-specific contract          | Infrastructure phase: update YAML/generator/generated exports, validate single-source constraints, and render PDF without claiming Lean build success.                                                                     |
| Title / state                         | Implementation Packet Generator                                                                                                                                                                                            |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.                                                   |
| Source-to-CNNA mapping                | Consumes module-theory/end-theory ledgers once available; before then marks theory context as unknown-not-input.                                                                                                           |
| Dependency-depth audit                | Depends on 1.1.1.5 and earlier governance gates. It must not block the current active 1.1.1.2 blue-correction ledger; it is a future scaling/tooling refinement.                                                           |
| Phase split decision                  | Atomic planned subphase under 1.1.1.5. Split only if implementation would otherwise mix Lean-code changes with tool/PDF/YAML changes.                                                                                      |
| Positive path plan                    | Implement by extending Python/YAML/generated exports first. Do not add Lean code. If a Lean-side audit mirror becomes necessary, create a separate later Lean phase with an explicit finite witness and import policy.     |
| Module implementation manifest        | Tooling subphase. Proposed generated artifacts: active-phase implementation packet TSV/JSON/TeX                                                                                                                            |
| Semantic placement decision           | Belongs under 1.1.1.5 generated-view authority/implementation-lock tooling. It must not patch mathematical consumers.                                                                                                      |
| Reuse and duplication audit           | Reuse existing single YAML master and scripts/generate_tables.py. Avoid parallel masters or a second manually maintained planning source.                                                                                  |
| Canonical generator policy            | Extend the existing Python generator in the smallest possible way; exports are generated TSV/JSON/TeX, not manually edited tables.                                                                                         |
| Module compactness rule               | Keep PDF slices compact; full data remains in generated TSV/JSON exports.                                                                                                                                                  |
| Refactor regression protocol          | Not a Lean refactor. If Python generator is changed, run generator validation and render-check the affected PDF sections.                                                                                                  |
| Refactor migration metrics            | No Lean declaration migration. Record generator/export changes only when the phase becomes active.                                                                                                                         |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction           | Future Lean phases may consume only compact implementation packets and the relevant ledger slices, not broad manual PDF scans.                                                                                             |
| Governance-overhead review            | This phase exists to reduce governance overhead during Lean work by pushing routine collection/rendering into Python.                                                                                                      |
| Proof rehearsal before implementation | Validate generator output, single YAML source, exactly one active phase, unchanged Lean-data timestamp, and section-specific rendering. This is a tooling proof rehearsal, not a Lean theorem.                             |
| Expected tactics                      | No Lean tactics expected. If a later Lean mirror is explicitly introduced, use explicit records/constructors and avoid @[simp], noncomputable operational paths, classical helpers, and broad fragile rewrites.            |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Expected mathlib imports               | No new mathlib imports expected for the planned Python/YAML tooling route.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
| Concrete computable instance traversal | Not an operational Lean phase. The concrete tooling witness is generated exports and PDF rendering over the current single YAML master.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                   |
| Computable path non-skeleton status    | not-applicable-tooling-only;<br>no operational mathematical computation is introduced                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Expected executable witness            | Python generator run plus generated TSV/TeX/PDF artifacts;<br>no Lean executable witness required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Mathlib complication log               | No mathlib complication expected because this is a Python/YAML/PDF tooling phase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Noncomputable boundary audit           | No Lean operational path is modified;<br>any noncomputable/classical concern indicates accidental drift into Lean code and requires a separate phase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Bridge gap status                      | No mathematical bridge is introduced here. Local background theory and large end-theory comparison roles are tracked as metadata/ledgers, not as CNNA generators.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Natural backjump/refactor layer        | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| How implemented                        | No completed implementation record yet. This future tooling/governance phase was introduced by Tool V1.04 and must remain inactive until its predecessor gates and active cursor allow it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Verification / evidence                | Not applicable yet;<br>phase is a planned Tool V1.04 implementation-scaling subphase. Lean-data timestamp remains unchanged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Post-implementation plan check         | After closure, update linked objects, generated exports/PDF, and advance exactly one active cursor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Implementation notes                   | Generate the phase-local packet with goal, source objects, producer/consumer modules, red blockers, yellow risks, forbidden shortcuts, expected artifacts, and comparison-only warnings. Packet should fit on a small number of pages/rows and link to full TSV/JSON exports rather than embedding full inventories.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      |

### Phase 1.1.1.5.3 – Incremental Lean inventory and file-hash cache

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                 |

| Implementation status                 | planned-not-active                                                                                                                                                                                                     |
| Preparation status                    | planned-not-active                                                                                                                                                                                                     |
| Phase type                            | infrastructure                                                                                                                                                                                                         |
| Phase-type-specific contract          | Infrastructure phase: update YAML/generator/generated exports, validate single-source constraints, and render PDF without claiming Lean build success.                                                                 |
| Title / state                         | Incremental Lean inventory and file-hash cache                                                                                                                                                                         |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.                                               |
| Source-to-CNNA mapping                | May infer rough local background categories from imports, but must mark them heuristic until semantically confirmed.                                                                                                   |
| Dependency-depth audit                | Depends on 1.1.1.5 and earlier governance gates. It must not block the current active 1.1.1.2 blue-correction ledger; it is a future scaling/tooling refinement.                                                       |
| Phase split decision                  | Atomic planned subphase under 1.1.1.5. Split only if implementation would otherwise mix Lean-code changes with tool/PDF/YAML changes.                                                                                  |
| Positive path plan                    | Implement by extending Python/YAML/generated exports first. Do not add Lean code. If a Lean-side audit mirror becomes necessary, create a separate later Lean phase with an explicit finite witness and import policy. |
| Module implementation manifest        | Tooling subphase. Proposed generated artifacts: file-hash cache; declaration cache; inventory-delta TSV                                                                                                                |
| Semantic placement decision           | Belongs under 1.1.1.5 generated-view authority/implementation-lock tooling. It must not patch mathematical consumers.                                                                                                  |
| Reuse and duplication audit           | Reuse existing single YAML master and scripts/generate_tables.py. Avoid parallel masters or a second manually maintained planning source.                                                                              |
| Canonical generator policy            | Extend the existing Python generator in the smallest possible way; exports are generated TSV/JSON/TeX, not manually edited tables.                                                                                     |
| Module compactness rule               | Keep PDF slices compact; full data remains in generated TSV/JSON exports.                                                                                                                                              |
| Refactor regression protocol          | Not a Lean refactor. If Python generator is changed, run generator validation and render-check the affected PDF sections.                                                                                              |
| Refactor migration metrics            | No Lean declaration migration. Record generator/export changes only when the phase becomes active.                                                                                                                     |

|                                        |                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                        |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                  |
| Consumer-contract direction            | Future Lean phases may consume only compact implementation packets and the relevant ledger slices, not broad manual PDF scans.                                                                                                                                                                                                    |
| Governance-overhead review             | This phase exists to reduce governance overhead during Lean work by pushing routine collection/rendering into Python.                                                                                                                                                                                                             |
| Proof rehearsal before implementation  | Validate generator output, single YAML source, exactly one active phase, unchanged Lean-data timestamp, and section-specific rendering. This is a tooling proof rehearsal, not a Lean theorem.                                                                                                                                    |
| Expected tactics                       | No Lean tactics expected. If a later Lean mirror is explicitly introduced, use explicit records/constructors and avoid @[simp], noncomputable operational paths, classical helpers, and broad fragile rewrites.                                                                                                                   |
| Expected mathlib imports               | No new mathlib imports expected for the planned Python/YAML tooling route.                                                                                                                                                                                                                                                        |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                                                                                                                            |
| Concrete computable instance traversal | Not an operational Lean phase. The concrete tooling witness is generated exports and PDF rendering over the current single YAML master.                                                                                                                                                                                           |
| Computable path non-skeleton status    | not-applicable-tooling-only;<br>no operational mathematical computation is introduced                                                                                                                                                                                                                                             |
| Expected executable witness            | Python generator run plus generated TSV/TeX/PDF artifacts;<br>no Lean executable witness required.                                                                                                                                                                                                                                |
| Mathlib complication log               | No mathlib complication expected because this is a Python/YAML/PDF tooling phase.                                                                                                                                                                                                                                                 |
| Noncomputable boundary audit           | No Lean operational path is modified;<br>any noncomputable/classical concern indicates accidental drift into Lean code and requires a separate phase.                                                                                                                                                                             |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                         |
| Bridge gap status                      | No mathematical bridge is introduced here. Local background theory and large end-theory comparison roles are tracked as metadata/ledgers, not as CNNA generators.                                                                                                                                                                 |
| Natural backjump/refactor layer        | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                                                                                                                          |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                       |
| How implemented                        | No completed implementation record yet. This future tooling/governance phase was introduced by Tool V1.04 and must remain inactive until its predecessor gates and active cursor allow it.                                                                                                                                        |
| Verification / evidence                | Not applicable yet;<br>phase is a planned Tool V1.04 implementation-scaling subphase. Lean-data timestamp remains unchanged.                                                                                                                                                                                                      |
| Post-implementation plan check         | After closure, update linked objects, generated exports/PDF, and advance exactly one active cursor.                                                                                                                                                                                                                               |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                    |
| Implementation notes                   | Avoid rescanning/rendering everything by caching file hashes, module declarations, import edges, and symbol-reference candidates between Lean-data updates. Only changed Lean files and dependent generated summaries are refreshed;<br>full inventory rebuild remains available as audit-full.                                   |

| Reusable existing modules            | <ul style="list-style-type: none"> <li><code>scripts/generate_tables.py</code></li> <li><code>repo_inventory/raw_export/modules.json</code></li> <li><code>repo_inventory/raw_export/symbol_references/*.json</code></li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Duplicate-risk symbols or operations | <ul style="list-style-type: none"> <li>parallel planning master</li> <li>manual duplicate theory ledger</li> <li>full graph dumped into PDF</li> <li>end theory used as CNNA producer</li> </ul>                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |

### Phase 1.1.1.5.4 – Module theory context ledger

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                            |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #f2f2f2;">W</span>                                                                                                                                 |
| Context class                         | LeanGovernancePhase                                                                                                                                                               |
| Phase documentation tier              | F2                                                                                                                                                                                |
| Phase documentation depth requirement | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.     |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                               |
| Implementation status                 | planned-not-active                                                                                                                                                                |
| Preparation status                    | planned-not-active                                                                                                                                                                |
| Phase type                            | infrastructure                                                                                                                                                                    |
| Phase-type-specific contract          | Infrastructure phase: update YAML/generator/generated exports, validate single-source constraints, and render PDF without claiming Lean build success.                            |
| Title / state                         | Module theory context ledger                                                                                                                                                      |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.          |
| Source-to-CNNA mapping                | Local established theory is allowed formalization context, never ontic CNNA generator. Examples: Matrix, Finset, Polynomial, graph/linear algebra, Schur-style algebraic methods. |
| Dependency-depth audit                | Depends on 1.1.1.5 and earlier governance gates. It must not block the current active 1.1.1.2 blue-correction ledger; it is a future scaling/tooling refinement.                  |
| Phase split decision                  | Atomic planned subphase under 1.1.1.5. Split only if implementation would otherwise mix Lean-code changes with tool/PDF/YAML changes.                                             |

|                                        |                                                                                                                                                                                                                                                                                                                                                        |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positive path plan                     | Implement by extending Python/YAML/generated exports first. Do not add Lean code. If a Lean-side audit mirror becomes necessary, create a separate later Lean phase with an explicit finite witness and import policy.                                                                                                                                 |
| Module implementation manifest         | Tooling subphase. Proposed generated artifacts: module-theory-context ledger TSV; active-module slice                                                                                                                                                                                                                                                  |
| Semantic placement decision            | Belongs under 1.1.1.5 generated-view authority/implementation-lock tooling. It must not patch mathematical consumers.                                                                                                                                                                                                                                  |
| Reuse and duplication audit            | Reuse existing single YAML master and scripts/generate_tables.py. Avoid parallel masters or a second manually maintained planning source.                                                                                                                                                                                                              |
| Canonical generator policy             | Extend the existing Python generator in the smallest possible way; exports are generated TSV/JSON/TeX, not manually edited tables.                                                                                                                                                                                                                     |
| Module compactness rule                | Keep PDF slices compact; full data remains in generated TSV/JSON exports.                                                                                                                                                                                                                                                                              |
| Refactor regression protocol           | Not a Lean refactor. If Python generator is changed, run generator validation and render-check the affected PDF sections.                                                                                                                                                                                                                              |
| Refactor migration metrics             | No Lean declaration migration. Record generator/export changes only when the phase becomes active.                                                                                                                                                                                                                                                     |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                                             |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                                     |
| Consumer-contract direction            | Future Lean phases may consume only compact implementation packets and the relevant ledger slices, not broad manual PDF scans.                                                                                                                                                                                                                         |
| Governance-overhead review             | This phase exists to reduce governance overhead during Lean work by pushing routine collection/rendering into Python.                                                                                                                                                                                                                                  |
| Proof rehearsal before implementation  | Validate generator output, single YAML source, exactly one active phase, unchanged Lean-data timestamp, and section-specific rendering. This is a tooling proof rehearsal, not a Lean theorem.                                                                                                                                                         |
| Expected tactics                       | No Lean tactics expected. If a later Lean mirror is explicitly introduced, use explicit records/constructors and avoid @[simp], noncomputable operational paths, classical helpers, and broad fragile rewrites.                                                                                                                                        |
| Expected mathlib imports               | No new mathlib imports expected for the planned Python/YAML tooling route.                                                                                                                                                                                                                                                                             |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                                                                                                                                                 |
| Concrete computable instance traversal | Not an operational Lean phase. The concrete tooling witness is generated exports and PDF rendering over the current single YAML master.                                                                                                                                                                                                                |
| Computable path non-skeleton status    | not-applicable-tooling-only;<br>no operational mathematical computation is introduced                                                                                                                                                                                                                                                                  |
| Expected executable witness            | Python generator run plus generated TSV/TeX/PDF artifacts;<br>no Lean executable witness required.                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No mathlib complication expected because this is a Python/YAML/PDF tooling phase.                                                                                                                                                                                                                                                                      |
| Noncomputable boundary audit           | No Lean operational path is modified;<br>any noncomputable/classical concern indicates accidental drift into Lean code and requires a separate phase.                                                                                                                                                                                                  |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                              |
| Bridge gap status                      | No mathematical bridge is introduced here. Local background theory and large end-theory comparison roles are tracked as metadata/ledgers, not as CNNA generators.                                                                                                                                                                                      |
| Natural backjump/refactor layer        | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                                                                                                                                               |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation.                      |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                            |
| How implemented                        | No completed implementation record yet. This future tooling/governance phase was introduced by Tool V1.04 and must remain inactive until its predecessor gates and active cursor allow it.                                                                                                                                                             |
| Verification / evidence                | Not applicable yet;<br>phase is a planned Tool V1.04 implementation-scaling subphase. Lean-data timestamp remains unchanged.                                                                                                                                                                                                                           |
| Post-implementation plan check         | After closure, update linked objects, generated exports/PDF, and advance exactly one active cursor.                                                                                                                                                                                                                                                    |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                         |
| Implementation notes                   | Track local established mathematical background per module as formal language, proof method, library/API context, implementation substrate, or comparison lemma context. Start with active/relevant modules only;<br>do not manually annotate all modules at once. Python proposes rows from imports;<br>semantic closure is explicit and phase-bound. |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 1.1.1.5.5 – End-theory comparison ledger

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Preparation status                    | planned-not-active                                                                                                                                                            |
| Phase type                            | infrastructure                                                                                                                                                                |

|                                        |                                                                                                                                                                                                                                                                                                                                   |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase-type-specific contract           | Infrastructure phase: update YAML/generator/generated exports, validate single-source constraints, and render PDF without claiming Lean build success.                                                                                                                                                                            |
| Title / state                          | End-theory comparison ledger                                                                                                                                                                                                                                                                                                      |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.                                                                                                                                                          |
| Source-to-CNNA mapping                 | End theories are target structures, consistency checks, terminology alignment, or obstruction/comparison mirrors; forbidden as CNNA producers.                                                                                                                                                                                    |
| Dependency-depth audit                 | Depends on 1.1.1.5 and earlier governance gates. It must not block the current active 1.1.1.2 blue-correction ledger; it is a future scaling/tooling refinement.                                                                                                                                                                  |
| Phase split decision                   | Atomic planned subphase under 1.1.1.5. Split only if implementation would otherwise mix Lean-code changes with tool/PDF/YAML changes.                                                                                                                                                                                             |
| Positive path plan                     | Implement by extending Python/YAML/generated exports first. Do not add Lean code. If a Lean-side audit mirror becomes necessary, create a separate later Lean phase with an explicit finite witness and import policy.                                                                                                            |
| Module implementation manifest         | Tooling subphase. Proposed generated artifacts: end-theory-comparison ledger TSV; comparison-boundary table                                                                                                                                                                                                                       |
| Semantic placement decision            | Belongs under 1.1.1.5 generated-view authority/implementation-lock tooling. It must not patch mathematical consumers.                                                                                                                                                                                                             |
| Reuse and duplication audit            | Reuse existing single YAML master and scripts/generate_tables.py. Avoid parallel masters or a second manually maintained planning source.                                                                                                                                                                                         |
| Canonical generator policy             | Extend the existing Python generator in the smallest possible way; exports are generated TSV/JSON/TeX, not manually edited tables.                                                                                                                                                                                                |
| Module compactness rule                | Keep PDF slices compact; full data remains in generated TSV/JSON exports.                                                                                                                                                                                                                                                         |
| Refactor regression protocol           | Not a Lean refactor. If Python generator is changed, run generator validation and render-check the affected PDF sections.                                                                                                                                                                                                         |
| Refactor migration metrics             | No Lean declaration migration. Record generator/export changes only when the phase becomes active.                                                                                                                                                                                                                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                                                        |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                                |
| Consumer-contract direction            | Future Lean phases may consume only compact implementation packets and the relevant ledger slices, not broad manual PDF scans.                                                                                                                                                                                                    |
| Governance-overhead review             | This phase exists to reduce governance overhead during Lean work by pushing routine collection/rendering into Python.                                                                                                                                                                                                             |
| Proof rehearsal before implementation  | Validate generator output, single YAML source, exactly one active phase, unchanged Lean-data timestamp, and section-specific rendering. This is a tooling proof rehearsal, not a Lean theorem.                                                                                                                                    |
| Expected tactics                       | No Lean tactics expected. If a later Lean mirror is explicitly introduced, use explicit records/constructors and avoid @[simp], noncomputable operational paths, classical helpers, and broad fragile rewrites.                                                                                                                   |
| Expected mathlib imports               | No new mathlib imports expected for the planned Python/YAML tooling route.                                                                                                                                                                                                                                                        |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                                                                                                                            |
| Concrete computable instance traversal | Not an operational Lean phase. The concrete tooling witness is generated exports and PDF rendering over the current single YAML master.                                                                                                                                                                                           |
| Computable path non-skeleton status    | not-applicable-tooling-only;<br>no operational mathematical computation is introduced                                                                                                                                                                                                                                             |
| Expected executable witness            | Python generator run plus generated TSV/TeX/PDF artifacts;<br>no Lean executable witness required.                                                                                                                                                                                                                                |
| Mathlib complication log               | No mathlib complication expected because this is a Python/YAML/PDF tooling phase.                                                                                                                                                                                                                                                 |
| Noncomputable boundary audit           | No Lean operational path is modified;<br>any noncomputable/classical concern indicates accidental drift into Lean code and requires a separate phase.                                                                                                                                                                             |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                         |
| Bridge gap status                      | No mathematical bridge is introduced here. Local background theory and large end-theory comparison roles are tracked as metadata/ledgers, not as CNNA generators.                                                                                                                                                                 |
| Natural backjump/refactor layer        | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                                                                                                                          |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                       |
| How implemented                        | No completed implementation record yet. This future tooling/governance phase was introduced by Tool V1.04 and must remain inactive until its predecessor gates and active cursor allow it.                                                                                                                                        |
| Verification / evidence                | Not applicable yet;<br>phase is a planned Tool V1.04 implementation-scaling subphase. Lean-data timestamp remains unchanged.                                                                                                                                                                                                      |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Post-implementation plan check       | After closure, update linked objects, generated exports/PDF, and advance exactly one active cursor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Artifact packaging rule              | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Implementation notes                 | Track large established target theories as comparison-only horizons: AQFT/QFT, OQS, modular forms, CM, elliptic functions/curves, L-functions, Moonshine, renormalization, operator algebras, spectral geometry, etc. Only record end theories that constrain current or near-future phases; do not build encyclopedia entries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

### Phase 1.1.1.5.6 – Active object graph slices

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                    | Record              |
|--------------------------|---------------------|
| Phase status             | W                   |
| Context class            | LeanGovernancePhase |
| Phase documentation tier | F2                  |

|                                        |                                                                                                                                                                                                                            |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase documentation depth requirement  | Standard dossier: short definition, source objects, proof target, implementation location, and next documentation action. No large narrative unless it blocks implementation.                                              |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                         |

| Implementation status                  | planned-not-active                                                                                                                                                                                                         |
| Preparation status                     | planned-not-active                                                                                                                                                                                                         |
| Phase type                             | infrastructure                                                                                                                                                                                                             |
| Phase-type-specific contract           | Infrastructure phase: update YAML/generator/generated exports, validate single-source constraints, and render PDF without claiming Lean build success.                                                                     |
| Title / state                          | Active object graph slices                                                                                                                                                                                                 |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.                                                   |
| Source-to-CNNA mapping                 | Graph edges distinguish internal provenance, local formalization context, and external comparison-only references.                                                                                                         |
| Dependency-depth audit                 | Depends on 1.1.1.5 and earlier governance gates. It must not block the current active 1.1.1.2 blue-correction ledger; it is a future scaling/tooling refinement.                                                           |
| Phase split decision                   | Atomic planned subphase under 1.1.1.5. Split only if implementation would otherwise mix Lean-code changes with tool/PDF/YAML changes.                                                                                      |
| Positive path plan                     | Implement by extending Python/YAML/generated exports first. Do not add Lean code. If a Lean-side audit mirror becomes necessary, create a separate later Lean phase with an explicit finite witness and import policy.     |
| Module implementation manifest         | Tooling subphase. Proposed generated artifacts: active-object-neighborhood DOT/SVG/PDF; graph-slice TSV/JSON                                                                                                               |
| Semantic placement decision            | Belongs under 1.1.1.5 generated-view authority/implementation-lock tooling. It must not patch mathematical consumers.                                                                                                      |
| Reuse and duplication audit            | Reuse existing single YAML master and scripts/generate_tables.py. Avoid parallel masters or a second manually maintained planning source.                                                                                  |
| Canonical generator policy             | Extend the existing Python generator in the smallest possible way; exports are generated TSV/JSON/TeX, not manually edited tables.                                                                                         |
| Module compactness rule                | Keep PDF slices compact; full data remains in generated TSV/JSON exports.                                                                                                                                                  |
| Refactor regression protocol           | Not a Lean refactor. If Python generator is changed, run generator validation and render-check the affected PDF sections.                                                                                                  |
| Refactor migration metrics             | No Lean declaration migration. Record generator/export changes only when the phase becomes active.                                                                                                                         |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                         |
| Consumer-contract direction            | Future Lean phases may consume only compact implementation packets and the relevant ledger slices, not broad manual PDF scans.                                                                                             |
| Governance-overhead review             | This phase exists to reduce governance overhead during Lean work by pushing routine collection/rendering into Python.                                                                                                      |
| Proof rehearsal before implementation  | Validate generator output, single YAML source, exactly one active phase, unchanged Lean-data timestamp, and section-specific rendering. This is a tooling proof rehearsal, not a Lean theorem.                             |
| Expected tactics                       | No Lean tactics expected. If a later Lean mirror is explicitly introduced, use explicit records/constructors and avoid @[simp], noncomputable operational paths, classical helpers, and broad fragile rewrites.            |
| Expected mathlib imports               | No new mathlib imports expected for the planned Python/YAML tooling route.                                                                                                                                                 |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                     |
| Concrete computable instance traversal | Not an operational Lean phase. The concrete tooling witness is generated exports and PDF rendering over the current single YAML master.                                                                                    |
| Computable path non-skeleton status    | not-applicable-tooling-only;<br>no operational mathematical computation is introduced                                                                                                                                      |
| Expected executable witness            | Python generator run plus generated TSV/TeX/PDF artifacts;<br>no Lean executable witness required.                                                                                                                         |
| Mathlib complication log               | No mathlib complication expected because this is a Python/YAML/PDF tooling phase.                                                                                                                                          |
| Noncomputable boundary audit           | No Lean operational path is modified;<br>any noncomputable/classical concern indicates accidental drift into Lean code and requires a separate phase.                                                                      |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                  |
| Bridge gap status                      | No mathematical bridge is introduced here. Local background theory and large end-theory comparison roles are tracked as metadata/ledgers, not as CNNA generators.                                                          |
| Natural backjump/refactor layer        | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                   |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |

| Implementation prompt contract       | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| How implemented                      | No completed implementation record yet. This future tooling/governance phase was introduced by Tool V1.04 and must remain inactive until its predecessor gates and active cursor allow it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Verification / evidence              | Not applicable yet;<br>phase is a planned Tool V1.04 implementation-scaling subphase. Lean-data timestamp remains unchanged.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              |
| Post-implementation plan check       | After closure, update linked objects, generated exports/PDF, and advance exactly one active cursor.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       |
| Artifact packaging rule              | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Implementation notes                 | Render small producer-consumer/provenance neighborhoods around the active phase and active CNNA objects rather than dumping the full object/declaration graph into the PDF. Depth 1-2 graph slices only in PDF;<br>full graph exported as DOT/JSON for optional audit.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

### Phase 1.1.1.5.7 – Red-blocker addressing-phase generator

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Implementation status                  | planned-not-active                                                                                                                                                                                                         |
| Preparation status                     | planned-not-active                                                                                                                                                                                                         |
| Phase type                             | infrastructure                                                                                                                                                                                                             |
| Phase-type-specific contract           | Infrastructure phase: update YAML/generator/generated exports, validate single-source constraints, and render PDF without claiming Lean build success.                                                                     |
| Title / state                          | Red-blocker addressing-phase generator                                                                                                                                                                                     |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Only write records belonging to this phase; register later-phase theory as missing-source or future-target entries.                                                   |
| Source-to-CNNA mapping                 | If the blocker is an imported end-theory assumption, route to internal derivation/comparison-boundary phase rather than patching the consumer.                                                                             |
| Dependency-depth audit                 | Depends on 1.1.1.5 and earlier governance gates. It must not block the current active 1.1.1.2 blue-correction ledger; it is a future scaling/tooling refinement.                                                           |
| Phase split decision                   | Atomic planned subphase under 1.1.1.5. Split only if implementation would otherwise mix Lean-code changes with tool/PDF/YAML changes.                                                                                      |
| Positive path plan                     | Implement by extending Python/YAML/generated exports first. Do not add Lean code. If a Lean-side audit mirror becomes necessary, create a separate later Lean phase with an explicit finite witness and import policy.     |
| Module implementation manifest         | Tooling subphase. Proposed generated artifacts: red-blocker phase-proposal TSV; accepted phase rows only after approval                                                                                                    |
| Semantic placement decision            | Belongs under 1.1.1.5 generated-view authority/implementation-lock tooling. It must not patch mathematical consumers.                                                                                                      |
| Reuse and duplication audit            | Reuse existing single YAML master and scripts/generate_tables.py. Avoid parallel masters or a second manually maintained planning source.                                                                                  |
| Canonical generator policy             | Extend the existing Python generator in the smallest possible way; exports are generated TSV/JSON/TeX, not manually edited tables.                                                                                         |
| Module compactness rule                | Keep PDF slices compact; full data remains in generated TSV/JSON exports.                                                                                                                                                  |
| Refactor regression protocol           | Not a Lean refactor. If Python generator is changed, run generator validation and render-check the affected PDF sections.                                                                                                  |
| Refactor migration metrics             | No Lean declaration migration. Record generator/export changes only when the phase becomes active.                                                                                                                         |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $Q \times Q$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                           |
| Consumer-contract direction            | Future Lean phases may consume only compact implementation packets and the relevant ledger slices, not broad manual PDF scans.                                                                                             |
| Governance-overhead review             | This phase exists to reduce governance overhead during Lean work by pushing routine collection/rendering into Python.                                                                                                      |
| Proof rehearsal before implementation  | Validate generator output, single YAML source, exactly one active phase, unchanged Lean-data timestamp, and section-specific rendering. This is a tooling proof rehearsal, not a Lean theorem.                             |
| Expected tactics                       | No Lean tactics expected. If a later Lean mirror is explicitly introduced, use explicit records/constructors and avoid @[simp], noncomputable operational paths, classical helpers, and broad fragile rewrites.            |
| Expected mathlib imports               | No new mathlib imports expected for the planned Python/YAML tooling route.                                                                                                                                                 |
| ExecComplex/computable plan            | No ExecComplex object is introduced. This gate only classifies consumption/API status.                                                                                                                                     |
| Concrete computable instance traversal | Not an operational Lean phase. The concrete tooling witness is generated exports and PDF rendering over the current single YAML master.                                                                                    |
| Computable path non-skeleton status    | not-applicable-tooling-only; no operational mathematical computation is introduced                                                                                                                                         |
| Expected executable witness            | Python generator run plus generated TSV/TeX/PDF artifacts; no Lean executable witness required.                                                                                                                            |
| Mathlib complication log               | No mathlib complication expected because this is a Python/YAML/PDF tooling phase.                                                                                                                                          |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           |
|--------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Noncomputable boundary audit         | No Lean operational path is modified;<br>any noncomputable/classical concern indicates accidental drift into Lean code and requires a separate phase.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |
| Mathlib mitigation/refactor layer    | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Bridge gap status                    | No mathematical bridge is introduced here. Local background theory and large end-theory comparison roles are tracked as metadata/ledgers, not as CNNA generators.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Natural backjump/refactor layer      | Backjump to the earliest natural layer: consumption classifier, blue-object correction ledger, public API contract, pruning ledger, Legacy.StatusGates, CoreSymbols, or import firewall.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  |
| Implementation prompt contract       | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, verify module manifest/reuse audit before adding Lean code, and verify plan points after implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| Global no-go inheritance             | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| How implemented                      | No completed implementation record yet. This future tooling/governance phase was introduced by Tool V1.04 and must remain inactive until its predecessor gates and active cursor allow it.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Phase 1.1.2 – Quarantine single-constructor legacy status gates

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                  |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                                                       |
| Context class                         | LeanRefactorPhase                                                                                                                                                                                                       |
| Phase documentation tier              | F3                                                                                                                                                                                                                      |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                               |

| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                     |
| Implementation status                 | planned-not-active                                                                                                                                                                                                      |
| Preparation status                    | [‘LEG0 split inventory from 1.1.1’, ‘Arithmetic/Notation.lean legacy status declarations’]                                                                                                                              |
| Phase type                            | refactor                                                                                                                                                                                                                |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                 |
| Title / state                         | Quarantine single-constructor legacy status gates                                                                                                                                                                       |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                             |
| Source-to-CNNA mapping                | Consumes classification bucket from 1.1.1.1.4 and public API contract from 1.1.1.3; moves only legacy-status/legacy-policy single-constructor gates into quarantine.                                                    |
| Dependency-depth audit                | Do not begin until the consumption map and public API contract are closed. A single-constructor inductive can still be a proof bridge; classification, not constructor count alone, decides.                            |
| Phase split decision                  | Create Legacy/StatusGates.lean; move or reexport status declarations; update legacy imports only; do not expose this module to Phase 3+.                                                                                |
| Positive path plan                    | Move/reexport only classified legacy gates; preserve compatibility; do not delete; keep Phase 3+ firewall intact.                                                                                                       |
| Refactor regression protocol          | Required before implementation: wrapper-first incremental migration; bounded declaration batches; preserve compatibility aliases; no legacy status deletion; require local full-build evidence after delivered package. |
| Refactor migration metrics            | To fill before code: declarations_migrated_count; single-constructor status gates moved; aliases retained; imports changed; consumer modules updated; BuildAll impact; local build evidence source.                     |
| Lean/mathlib version policy           | No new mathlib imports expected. If any appear, stop and justify against Lean 4.28.0 baseline or open a separate gate.                                                                                                  |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                      |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Consumer-contract direction            | Phase 3+ must not import Legacy.StatusGates;<br>quarantine module is legacy-only with no public-final consumer path.                                                                                                                                                  |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | rfl/exact for definitional aliases;<br>no broad simplification.                                                                                                                                                                                                       |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                            |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00;<br>preserve existing computability boundaries.                                                                                                                                           |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected;<br>missing names/imports must be localized to the natural source/split layer.                                                                                                                                                        |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                          |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit;<br>no Lean build evidence has been recorded for this phase.                                                                                                                                          |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                   |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                            |

### Phase 1.1.3 – Create true CoreSymbols/Notation micro-surface

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                           |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | <span style="background-color: #FFFFFF; border: 1px solid black; padding: 0 2px;">W</span>                                                                                                                                                                       |
| Context class                         | <code>LeanRefactorPhase</code>                                                                                                                                                                                                                                   |
| Phase documentation tier              | F3                                                                                                                                                                                                                                                               |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                                                                        |

| Phase type                            | refactor                                                                                                                                                                                                                                                         |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                          |
| Title / state                         | Create true CoreSymbols/Notation micro-surface                                                                                                                                                                                                                   |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                      |
| Source-to-CNNA mapping                | Requires status-gate quarantine so CoreSymbols is not contaminated by single-constructor status enums.                                                                                                                                                           |
| Dependency-depth audit                | No further split unless CoreSymbols still has unrelated foundation/finite/handoff responsibilities after classification.                                                                                                                                         |
| Phase split decision                  | Create the minimal CoreSymbols surface and redirect neutral imports to it.                                                                                                                                                                                       |
| Positive path plan                    | Mostly module/import closure. Any public constant should be definitional and domain-role named.                                                                                                                                                                  |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                   |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.                         |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                               |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                    |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             |
| Proof rehearsal before implementation  | rfl/exact/constructor if any thin wrapper is needed.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                               |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |

Phase 1.1.4 – Separate legacy phase aliases from neutral wrappers and blue-object correction wrappers

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                     |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                           | W                                                                                                                                                                                                                          |
| Context class                          | LeanRefactorPhase                                                                                                                                                                                                          |
| Phase documentation tier               | F3                                                                                                                                                                                                                         |
| Phase documentation depth requirement  | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat.                                                                                  |
| Record change version                  | unchanged-by-V1.01                                                                                                                                                                                                         |
| Record change timestamp                | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                        |
| Implementation status                  | planned-not-active                                                                                                                                                                                                         |
| Preparation status                     | planned-not-active                                                                                                                                                                                                         |
| Phase type                             | refactor                                                                                                                                                                                                                   |
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                    |
| Title / state                          | Separate legacy phase aliases from neutral wrappers                                                                                                                                                                        |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                |
| Source-to-CNNA mapping                 | Requires CoreSymbols so neutral wrappers import a clean notation surface. Requires status gates quarantined.                                                                                                               |
| Dependency-depth audit                 | Split only if neutral wrappers require nontrivial theorem transport; then create predecessor source wrapper rather than proving in the alias layer.                                                                        |
| Phase split decision                   | Keep old code compiling through legacy aliases while new code imports neutral wrappers only.                                                                                                                               |
| Positive path plan                     | Forward old theorem/data by exact names or field projections; no semantic reinterpretation in alias layer.                                                                                                                 |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation  | exact existing_lemma;<br>rfl for abbreviation;<br>constructor/field projections for wrapper structures.                                                                                                                    |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                    |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                   |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                        |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                    |
| Expected executable witness            | not specified yet                                                                                                                                                                                                          |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                       |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                  |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Phase 1.1.5 – Post-split import firewall and Phase-3 visibility gate

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                    |
|---------------------------------------|-------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                         |
| Context class                         | ToolInfrastructurePhase                                                                                                                   |
| Phase documentation tier              | F3                                                                                                                                        |
| Phase documentation depth requirement | Compact record: what exists, why it exists, owning phase, source location, and whether it may affect Lean objects. Avoid proofbook bloat. |
| Record change version                 | unchanged-by-V1.01                                                                                                                        |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                       |
| Implementation status                 | planned-not-active                                                                                                                        |
| Preparation status                    | planned-not-active                                                                                                                        |
| Phase type                            | infrastructure                                                                                                                            |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase-type-specific contract           | Infrastructure/planning phase: justify absence of operational witness; close schema/decision prerequisites before code.                                                                                                                                               |
| Title / state                          | Post-split import firewall and Phase-3 visibility gate                                                                                                                                                                                                                |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                           |
| Source-to-CNNA mapping                 | Depends on all previous 1.1 subphases and regenerated module inventory. This is the gate before 1.2 and 3 can be trusted.                                                                                                                                             |
| Dependency-depth audit                 | No further split unless multiple forbidden import families remain; then backjump to the bucket causing the leak.                                                                                                                                                      |
| Phase split decision                   | Regenerate module inventory; search import graph for forbidden Legacy.StatusGates consumers; update phase 1.2/1.3/3 dependencies only after the firewall passes.                                                                                                      |
| Positive path plan                     | Structural import graph proof-by-audit, plus Lean build evidence supplied locally by user or actual environment if available.                                                                                                                                         |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | No proof tactics expected beyond exact/rfl for any final import wrappers.                                                                                                                                                                                             |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                               |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                              |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                                                           |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                          |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit; no Lean build evidence has been recorded for this phase.                                                                                                                                             |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                   |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                            |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Phase 1.2 – Foundation and generator Profile neutralization

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                 |
| Title / state                         | Foundation and generator Profile neutralization                                                                                                                                                         |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.             |
| Source-to-CNNA mapping                | Phase 1.2 establishes or neutralizes: ExecComplexPath; GeneratorProvenance; substrateProfile; LevelProfile; CarrierProfile. Object links are generated from the object register.                        |
| Dependency-depth audit                | Depends on 1.1.5; current foundation/generator modules; preliminary object IDs O00/G00-G04. This record exists so the phase can be prepared without reopening Phase 1.1.                                |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                           |

|                                        |                                                                                                                                                                                                                                                                                            |
|----------------------------------------|--------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Foundation/ExecComplex.lean;<br>CNNA/PillarA/Foundation/GeneratorProvenance.lean;<br>CNNA/PillarA/Foundation/Substrate/*.lean;<br>CNNA/PillarA/Foundation/LevelProfile.lean;<br>CNNA/PillarA/Foundation/CarrierProfile.lean. |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                                                 |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                                                |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                                     |
| Proof rehearsal before implementation  | No reindex/level/carrier without proof profile. ExecComplex remains the operational scalar path;<br>no noncomputable Complex replacement.                                                                                                                                                  |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                                                    |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                                                 |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00;<br>preserve existing computability boundaries.                                                                                                                                                                |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                        |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                                                    |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                                          |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                                       |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                                                  |
| Bridge gap status                      | No mathematical bridge expected;<br>missing names/imports must be localized to the natural source/split layer.                                                                                                                                                                             |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                                        |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation.                      |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                                               |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit;<br>no Lean build evidence has been recorded for this phase.                                                                                                                                                               |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                                        |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.                          |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                                                 |
| Source materials / references          | <ul style="list-style-type: none"> <li>GeneratedSource.lean;<br/>GeneratedMainPath.lean;<br/>BoundarySource/*.lean;<br/>Foundation/ExecComplex*.lean</li> <li>v22 corrected Phase-1 dependency hierarchy</li> </ul>                                                                        |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |

Phase 1.2.1 – Neutralize ExecComplex operational scalar boundary

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                           |

| Implementation status                 | planned-not-active                                                                                                                                                                                                                                               |
| Preparation status                    | planned-prepared                                                                                                                                                                                                                                                 |
| Phase type                            | refactor                                                                                                                                                                                                                                                         |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                                          |
| Title / state                         | Neutralize ExecComplex operational scalar boundary                                                                                                                                                                                                               |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                      |
| Source-to-CNNA mapping                | Phase 1.2.1 establishes or neutralizes: ExecComplexPath and computability boundary. Object links are generated from the object register.                                                                                                                         |
| Dependency-depth audit                | Depends on 1.2; current ExecComplex modules. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                                        |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                                    |
| Positive path plan                    | Implement only after dependencies close. Target: CNNA/PillarA/Foundation/ExecComplex.lean.                                                                                                                                                                       |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                   |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.                         |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | Expose only the computable operational scalar boundary and any mirror bridge explicitly; no analytic shortcut is allowed.                                                                                                                                             |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                               |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                               |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                              |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                                                           |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                          |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit; no Lean build evidence has been recorded for this phase.                                                                                                                                             |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                   |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                            |

Phase 1.2.1.1 – ExecComplex capability and limitation audit

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                                                                             |

| Title / state                         | ExecComplex capability and limitation audit                                                                                                                                                                                                                                                                        |
| Preparation workflow                  | computable scalar architecture workflow                                                                                                                                                                                                                                                                            |
| Source-to-CNNA mapping                | O00 dossier gets exact capability matrix and limitations.                                                                                                                                                                                                                                                          |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Scalar architecture decisions must precede code implementation. Exact quadratic or CD scalar routes may not feed earlier generator definitions.                 |
| Phase split decision                  | split out because ExecComplex limits affect Phase 1.2, 4, 5, 7, 8 and CD bridges differently.                                                                                                                                                                                                                      |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Keep current QxQ path first; add exact quadratic pilot only if needed by finite tests and no duplicate module exists; keep analytic Complex mirror-only. |
| Module implementation manifest        | pending Phase 1.1.1.1.1                                                                                                                                                                                                                                                                                            |
| Semantic placement decision           | scalar-foundation / bridge governance, not generator semantics                                                                                                                                                                                                                                                     |
| Reuse and duplication audit           | must check existing ExecComplex, ExecComplexBridge, Schur.CharpolyC, ArithmeticCDBridge, and mathlib QuadraticAlgebra before proposing new module                                                                                                                                                                  |
| Canonical generator policy            | scalar layer must consume canonical generator outputs only; cannot define generator semantics                                                                                                                                                                                                                      |
| Module compactness rule               | do not create ExactQuadraticComplex unless existing foundation/bridge modules cannot carry the semantics cleanly                                                                                                                                                                                                   |
| Refactor regression protocol          | incremental wrapper mode; full local build green after each migration step                                                                                                                                                                                                                                         |

|                                        |                                                                                                                                                                                                                                                                 |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Refactor migration metrics             | track declarations migrated, imports changed, executable witnesses added                                                                                                                                                                                        |
| Lean/mathlib version policy            | 4.28.0 baseline unless version gate explicitly opens upgrade                                                                                                                                                                                                    |
| ExecComplex boundary policy            | EXEC-3 enforced: QxQ floor, exact quadratic optional, analytic Complex mirror-only                                                                                                                                                                              |
| Consumer-contract direction            | scalar layer consumes generator/arithmetic source data;<br>generator definitions do not consume scalar comparison/mirror data                                                                                                                                   |
| Governance-overhead review             | review after first scalar/module manifest whether this lock forced a concrete decision.                                                                                                                                                                         |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. Show coordinate equations for all O00 operations and prove unsupported requirements are redirected to O09 or mirror. |
| Expected tactics                       | explicit structures, constructor/projection lemmas, ring-normal-form only for coordinate arithmetic, no Matrix.inv and no consumer-side patch.                                                                                                                  |
| Expected mathlib imports               | Mathlib.Algebra.QuadraticAlgebra only if pilot approved;<br>Mathlib.Data.Complex.Basic remains bridge/mirror-only;<br>NumberField modules require version-policy gate.                                                                                          |
| ExecComplex/computable plan            | Direct QxQ path only.                                                                                                                                                                                                                                           |
| Concrete computable instance traversal | required later: QxQ baseline row, Q(i) row, Q(sqrt(-3)) row, and at least one generic D row if O09 is implemented                                                                                                                                               |
| Computable path non-skeleton status    | must be shown by concrete row witnesses                                                                                                                                                                                                                         |
| Expected executable witness            | finite row with rational ExecComplex output plus optional exact quadratic coordinate and rational/integer invariant projection                                                                                                                                  |
| Mathlib complication log               | Record Complex/Real noncomputable boundary, QuadraticAlgebra instance diamond warning, NumberField formal/non-executable dependency, and any required version-gate.                                                                                             |
| Noncomputable boundary audit           | General C/R and algebraic closure remain mirror/formal. Exact quadratic candidate must avoid noncomputable definitions on operational path.                                                                                                                     |
| Mathlib mitigation/refactor layer      | Use project-owned explicit Q-coordinate structure or narrowly wrapped QuadraticAlgebra;<br>isolate formal mathlib NumberField in mirror/proof layer.                                                                                                            |
| Bridge gap status                      | O09 candidate remains open.                                                                                                                                                                                                                                     |
| Natural backjump/refactor layer        | If exact quadratic data are needed, backjump to scalar-foundation layer rather than patching arithmetic/lattice consumers.                                                                                                                                      |
| Implementation prompt contract         | Before Lean code, module manifest must state exact module placement, imported mathlib modules, and why no existing module owns the semantics.                                                                                                                   |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                     |
| How implemented                        | Not implemented.                                                                                                                                                                                                                                                |
| Verification / evidence                | Generated-table validation pending/run after patch;<br>no Lean build.                                                                                                                                                                                           |
| Proof strategy                         | Show coordinate equations for all O00 operations and prove unsupported requirements are redirected to O09 or mirror.                                                                                                                                            |
| Build result                           | No Lean build executed or claimed.                                                                                                                                                                                                                              |
| Post-implementation plan check         | Check whether the scalar architecture lock prevented analytic/noncomputable leakage or duplicate scalar implementation.                                                                                                                                         |

### Phase 1.2.1.2 – Required exact quadratic scalar schema: discriminant-indexed minimal operational interface

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Source-to-CNNA mapping                | If implemented, O09 owns exact quadratic operations; ExecComplex remains rational floor.                                                                                                                                                                                                                                                               |
| Dependency-depth audit                | V1.19 status policy: locked red until a release proof references the prerequisite derived-only Lean objects and turns this phase yellow or orange. Scalar architecture decisions must precede code implementation. Exact quadratic or CD scalar routes may not feed earlier generator definitions.                                                     |
| Phase split decision                  | split out because ExecComplex limits affect Phase 1.2, 4, 5, 7, 8 and CD bridges differently.                                                                                                                                                                                                                                                          |
| Positive path plan                    | First prove/release the prerequisite derived-only Lean objects and record the pre-implementation check; only then may this phase become yellow or orange. Implement or wrap only a parameterized schema. Do not instantiate with D in this phase. The concrete D-instantiation belongs to Phase 4.5.1 after an operational discriminant ledger exists. |
| Module implementation manifest        | pending Phase 1.1.1.1.1                                                                                                                                                                                                                                                                                                                                |
| Semantic placement decision           | scalar-foundation / bridge governance, not generator semantics                                                                                                                                                                                                                                                                                         |
| Reuse and duplication audit           | must check existing ExecComplex, ExecComplexBridge, Schur.CharpolyC, ArithmeticCDBridge, and mathlib QuadraticAlgebra before proposing new module                                                                                                                                                                                                      |
| Canonical generator policy            | scalar layer must consume canonical generator outputs only; cannot define generator semantics                                                                                                                                                                                                                                                          |
| Module compactness rule               | do not create ExactQuadraticComplex unless existing foundation/bridge modules cannot carry the semantics cleanly                                                                                                                                                                                                                                       |
| Refactor regression protocol          | incremental wrapper mode; full local build green after each migration step                                                                                                                                                                                                                                                                             |
| Refactor migration metrics            | track declarations migrated, imports changed, executable witnesses added                                                                                                                                                                                                                                                                               |

|                                        |                                                                                                                                                                                                                                                                                                                      |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lean/mathlib version policy            | 4.28.0 baseline unless version gate explicitly opens upgrade                                                                                                                                                                                                                                                         |
| ExecComplex boundary policy            | Exact quadratic schema sits above QxQ as a discriminant-indexed operational extension; no free sqrt(D).                                                                                                                                                                                                              |
| Consumer-contract direction            | scalar layer consumes generator/arithmetic source data; generator definitions do not consume scalar comparison/mirror data                                                                                                                                                                                           |
| Governance-overhead review             | review after first scalar/module manifest whether this lock forced a concrete decision.                                                                                                                                                                                                                              |
| Proof rehearsal before implementation  | No implementation rehearsal authorized while red. Required rehearsal starts with prerequisite-object proof references and a release check. For arbitrary D, prove coordinate operations and formulas. Avoid analytic square roots; theta is the generator of the algebraic relation, not an external Complex number. |
| Expected tactics                       | explicit structures, constructor/projection lemmas, ring-normal-form only for coordinate arithmetic, no Matrix.inv and no consumer-side patch.                                                                                                                                                                       |
| Expected mathlib imports               | Prefer project-owned coordinate structure if mathlib dependencies cause noncomputable/classical leakage; otherwise audit Mathlib.Algebra.QuadraticAlgebra. AdjoinRoot remains proof/reference unless executable status is verified.                                                                                  |
| ExecComplex/computable plan            | O09 is required for exact quadratic coordinates, but it does not replace ExecComplex. Only projected rational/integer invariants flow back to QxQ reports.                                                                                                                                                           |
| Concrete computable instance traversal | Schema-level witnesses: symbolic arbitrary D, plus later planned special rows D=-1/-3/-4 only after D-ledger. This phase may include hand-written closed coordinate examples but cannot claim CNNA provenance for D.                                                                                                 |
| Computable path non-skeleton status    | must be shown by concrete row witnesses                                                                                                                                                                                                                                                                              |
| Expected executable witness            | finite row with rational ExecComplex output plus optional exact quadratic coordinate and rational/integer invariant projection                                                                                                                                                                                       |
| Mathlib complication log               | Audit QuadraticAlgebra coordinate operations, basis/noncomputable declarations, and version stability. AdjoinRoot quotient construction includes noncomputable instances in docs and must not silently enter operational path.                                                                                       |
| Noncomputable boundary audit           | No analytic sqrt, Real, Complex exponential, elliptic functions, or uninspected quotient field structure in operational code.                                                                                                                                                                                        |
| Mathlib mitigation/refactor layer      | Use project-owned explicit Q-coordinate structure or narrowly wrapped QuadraticAlgebra; isolate formal mathlib NumberField in mirror/proof layer.                                                                                                                                                                    |
| Bridge gap status                      | Schema can close only as parameterized. Concrete use remains open until 4.5.1 O10/BR14.                                                                                                                                                                                                                              |
| Natural backjump/refactor layer        | If exact quadratic data are needed, backjump to scalar-foundation layer rather than patching arithmetic/lattice consumers.                                                                                                                                                                                           |
| Implementation prompt contract         | Before Lean code, module manifest must state exact module placement, imported mathlib modules, and why no existing module owns the semantics.                                                                                                                                                                        |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                                                                             |
| How implemented                        | Not implemented.                                                                                                                                                                                                                                                                                                     |
| Verification / evidence                | Generated-table validation pending/run after patch; no Lean build.                                                                                                                                                                                                                                                   |
| Proof strategy                         | Pilot Q(i), Q(sqrt(-3)), and generic nonsquare D; prove norm/trace/conjugation formulas and executable witnesses.                                                                                                                                                                                                    |
| Build result                           | No Lean build executed or claimed.                                                                                                                                                                                                                                                                                   |
| Post-implementation plan check         | Check whether the scalar architecture lock prevented analytic/noncomputable leakage or duplicate scalar implementation.                                                                                                                                                                                              |
| Artifact packaging rule                | Return complete zip; Lean build local unless actually executed here.                                                                                                                                                                                                                                                 |
| Implementation notes                   | Future decision whether to add a compact exact quadratic operational layer.                                                                                                                                                                                                                                          |

### Phase 1.2.2 – Neutralize generator provenance source profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                  |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                                       |
| Context class                         | LeanRefactorPhase                                                                                                                                                                                       |
| Phase documentation tier              | F0                                                                                                                                                                                                      |
| Phase documentation depth requirement | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty. |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                      |

| Implementation status                 | planned-not-active                                                                                                                                                                                      |
| Preparation status                    | planned-prepared                                                                                                                                                                                        |
| Phase type                            | refactor                                                                                                                                                                                                |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                 |
| Title / state                         | Neutralize generator provenance source profile                                                                                                                                                          |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.             |
| Source-to-CNNA mapping                | Phase 1.2.2 establishes or neutralizes: GeneratorProvenance. Object links are generated from the object register.                                                                                       |
| Dependency-depth audit                | Depends on 1.2.1; generated source/main-path modules. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                      |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                           |
| Positive path plan                    | Implement only after dependencies close. Target: CNNA/PillarA/Foundation/GeneratorProvenance.lean.                                                                                                      |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.       |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.             |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                    |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | Forward existing provenance data through a neutral source profile; do not make substrate/level choices in this module.                                                                                                                                                |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                               |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                               |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                              |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                  |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                                                           |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                              |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                          |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit; no Lean build evidence has been recorded for this phase.                                                                                                                                             |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                   |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                            |

### Phase 1.2.3 – Neutralize regular substrate profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                                           |
|---------------------------------------|------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                                                                                                |

| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                      |
| Source-to-CNNA mapping                | Phase 1.2.3 establishes or neutralizes: substrate: regular branching. Object links are generated from the object register.                                                                                                                                       |
| Dependency-depth audit                | Depends on 1.2.2; regular branching substrate modules. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                              |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                                    |
| Positive path plan                    | Implement only after dependencies close. Target: CNNA/PillarA/Foundation/Substrate/Regular.lean.                                                                                                                                                                 |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                   |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and <code>legacy/coexistence</code> status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.                         |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                         |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                    |
| Governance-overhead review            | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                              |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Proof rehearsal before implementation  | Separate regular branching data from variable branching data;<br>no geometric angle/lattice assumption enters here.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00;<br>preserve existing computability boundaries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

Phase 1.2.4 – Neutralize variable substrate profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                     |

| Implementation status                  | planned-not-active                                                                                                                                                                                                         |
| Preparation status                     | planned-prepared                                                                                                                                                                                                           |
| Phase type                             | refactor                                                                                                                                                                                                                   |
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                    |
| Title / state                          | Neutralize variable substrate profile                                                                                                                                                                                      |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                |
| Source-to-CNNA mapping                 | Phase 1.2.4 establishes or neutralizes: substrate: variable branching. Object links are generated from the object register.                                                                                                |
| Dependency-depth audit                 | Depends on 1.2.2; variable branching and weight-policy modules. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                               |
| Phase split decision                   | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                              |
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Foundation/Substrate/Variable.lean.                                                                                                                          |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                   |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                        |
| Proof rehearsal before implementation  | Keep variable branching proof-carrying and explicit; no class/instance oracle hides the generated data.                                                                                                                    |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                    |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                    |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                   |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                        |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                       |
| Expected executable witness            | not specified yet                                                                                                                                                                                                          |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                       |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                  |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

| Artifact packaging rule              | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 |
| Implementation notes                 | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     |

### Phase 1.2.5 – Neutralize level and cutoff profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                 |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Title / state                          | Neutralize level and cutoff profile                                                                                                                                                                                                                                   |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                           |
| Source-to-CNNA mapping                 | Phase 1.2.5 establishes or neutralizes: Level / Cutoff. Object links are generated from the object register.                                                                                                                                                          |
| Dependency-depth audit                 | Depends on 1.2.2-1.2.4; level-history modules. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                                           |
| Phase split decision                   | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                                         |
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Foundation/LevelProfile.lean.                                                                                                                                                                           |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                              |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes; then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                   |
| Proof rehearsal before implementation  | Level selection must be provenance-carrying and cannot be conflated with later experiment requests.                                                                                                                                                                   |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                               |
| Expected mathlib imports               | No new mathlib imports expected; prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                               |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00; preserve existing computability boundaries.                                                                                                                                              |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet; must be explicit before operational implementation                                                                                                                                                                                                  |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected; missing names/imports must be localized to the natural source/split layer.                                                                                                                                                           |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes; all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                              |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                          |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit; no Lean build evidence has been recorded for this phase.                                                                                                                                             |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                   |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                            |

### Phase 1.2.6 – Neutralize carrier/index profile

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                                                              |
|---------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                                                                                   |

| Phase documentation tier              | F0                                                                                                                                                                                                                                                  |
| Phase documentation depth requirement | Full dossier required before promotion or consumption: definition, natural provenance, exact source objects, proof target, proof sketch, verification/audit, consumer rights, and semantic uncertainty.                                             |
| Record change version                 | unchanged-by-V1.01                                                                                                                                                                                                                                  |
| Record change timestamp               | Lean data 2026-05-10T05:51:42+02:00                                                                                                                                                                                                                 |
| Implementation status                 | planned-not-active                                                                                                                                                                                                                                  |
| Preparation status                    | planned-prepared                                                                                                                                                                                                                                    |
| Phase type                            | refactor                                                                                                                                                                                                                                            |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                                             |
| Title / state                         | Neutralize carrier/index profile                                                                                                                                                                                                                    |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                         |
| Source-to-CNNA mapping                | Phase 1.2.6 establishes or neutralizes: Carrier / index type. Object links are generated from the object register.                                                                                                                                  |
| Dependency-depth audit                | Depends on 1.2.5; recursive level-history carrier modules. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                             |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                       |
| Positive path plan                    | Implement only after dependencies close. Target: CNNA/PillarA/Foundation/CarrierProfile.lean.                                                                                                                                                       |
| Refactor regression protocol          | Not applicable unless <code>phase_type</code> is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                      |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill <code>declarations_migrated_count</code> , <code>imports_changed</code> , <code>import_graph_delta</code> , <code>consumer_breakage_audit</code> , and legacy/coexistence status before implementation. |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; <code>noncomputable</code> /classical pressure must be logged and isolated.            |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains $\mathbb{Q} \times \mathbb{Q}$ ; algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                  |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                       |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | Expose carrier, Fintype/DecidableEq/cardinality/equivalence data explicitly;<br>avoid high-arity index eliminators.                                                                                                                                                   |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                               |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                            |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00;<br>preserve existing computability boundaries.                                                                                                                                           |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |
| Expected executable witness            | not specified yet                                                                                                                                                                                                                                                     |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected;<br>missing names/imports must be localized to the natural source/split layer.                                                                                                                                                        |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                          |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit;<br>no Lean build evidence has been recorded for this phase.                                                                                                                                          |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                   |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build;<br>otherwise state that local Lean build is required.     |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                            |

| Preparation status                    | planned-prepared                                                                                                                                                                                                           |
| Phase type                            | refactor                                                                                                                                                                                                                   |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                    |
| Title / state                         | Regime, partition, and complement Profile neutralization                                                                                                                                                                   |
| Preparation workflow                  | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                |
| Source-to-CNNA mapping                | Phase 1.3 establishes or neutralizes: PartitionProfile;<br>RegimeProfile;<br>ComplementProfile. Object links are generated from the object register.                                                                       |
| Dependency-depth audit                | Depends on 1.2.6;<br>current partition/regime/complement modules;<br>preliminary object IDs G05-G10. This record exists so the phase can be prepared without reopening Phase 1.1.                                          |
| Phase split decision                  | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                              |
| Positive path plan                    | Implement only after dependencies close. Target: CNNA/PillarA/Schur/PartitionProfile.lean;<br>CNNA/PillarA/Regime/*.lean;<br>CNNA/PillarA/Regime/Complement/*.lean.                                                        |
| Refactor regression protocol          | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics            | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy           | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy           | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                |
| Consumer-contract direction           | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review            | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                     |
| Proof rehearsal before implementation | noOuter/hasOuter are A-derived regimes. Complement data is A-internal and must not leak directly to bright Pillar B.                                                                                                       |

|                                        |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    |
|----------------------------------------|----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                            |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                         |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00;<br>preserve existing computability boundaries.                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                        |

Phase 1.3.1 – Neutralize boundary/interface/interior partition profile

**Table legend.**   = green/closed and derived-only;   = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison;   = orange/implementable after stated predecessor closure;   = yellow/active and implementable now;   = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                  | Record                                                                                                                                                                                                                     |

| Preparation status                     | planned-prepared                                                                                                                                                                                                           |
| Phase type                             | refactor                                                                                                                                                                                                                   |
| Phase-type-specific contract           | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                                    |
| Title / state                          | Neutralize boundary/interface/interior partition profile                                                                                                                                                                   |
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                |
| Source-to-CNNA mapping                 | Phase 1.3.1 establishes or neutralizes: Boundary / interface / interior partition. Object links are generated from the object register.                                                                                    |
| Dependency-depth audit                 | Depends on 1.3;<br>generated boundary/interior partition modules. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                             |
| Phase split decision                   | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                              |
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Schur/PartitionProfile.lean.                                                                                                                                 |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                          |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated. |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                              |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                     |
| Proof rehearsal before implementation  | Partition is a source layer for Schur/DtN, not a consumer-side convention.                                                                                                                                                 |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                    |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                 |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00;<br>preserve existing computability boundaries.                                                                                                |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                        |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                    |
| Expected executable witness            | not specified yet                                                                                                                                                                                                          |
| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                       |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                               |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                  |
| Bridge gap status                      | No mathematical bridge expected;<br>missing names/imports must be localized to the natural source/split layer.                                                                                                             |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                        |

### Phase 1.3.2 – Neutralize noOuter/hasOuter regime split

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked  
Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.

| Field                                 | Record                                                                                                                                                                                                  |
|---------------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Phase status                          | W                                                                                                                                                                                                       |

| Preparation status                    | planned-prepared                                                                                                                                                                                        |
| Phase type                            | refactor                                                                                                                                                                                                |
| Phase-type-specific contract          | Refactor phase: record module/declaration migration metrics, import delta, consumer breakage audit, wrapper coexistence, and local full-build evidence before closeout.                                 |
| Title / state                         | Neutralize noOuter/hasOuter regime split                                                                                                                                                                |

|                                        |                                                                                                                                                                                                                                                                       |
|----------------------------------------|-----------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Preparation workflow                   | Phase-bound preparation from the single YAML master. Collect only source material needed by this phase; register later-phase material as future/missing-source rather than placing it here.                                                                           |
| Source-to-CNNA mapping                 | Phase 1.3.2 establishes or neutralizes: Regime: noOuterEnvironment;<br>Regime: hasOuterEnvironment. Object links are generated from the object register.                                                                                                              |
| Dependency-depth audit                 | Depends on 1.3.1;<br>sector/complement/environment modules. This record exists so the phase can be prepared without reopening Phase 1.1.                                                                                                                              |
| Phase split decision                   | Prepared as its own subphase because it has a distinct source/proof kind or generation layer.                                                                                                                                                                         |
| Positive path plan                     | Implement only after dependencies close. Target: CNNA/PillarA/Regime/NoOuter.lean;<br>CNNA/PillarA/Regime/HasOuter.lean.                                                                                                                                              |
| Refactor regression protocol           | Not applicable unless phase_type is refactor or the phase changes imports/declarations. If refactor applies: wrapper-first, bounded migration package, local full-build evidence before closeout.                                                                     |
| Refactor migration metrics             | Not recorded yet. Refactor phases must fill declarations_migrated_count, imports_changed, import_graph_delta, consumer_breakage_audit, and legacy/coexistence status before implementation.                                                                           |
| Lean/mathlib version policy            | Baseline is Lean 4.28.0/mathlib snapshot unless an explicit phase-boundary upgrade gate is opened. New imports must be verified against the chosen baseline; noncomputable/classical pressure must be logged and isolated.                                            |
| ExecComplex boundary policy            | Apply EXEC-2 when relevant: operational ExecComplex remains Q x Q;<br>algebraic irrational data stays mirror-only unless a rational/integer invariant is separately proved.                                                                                           |
| Consumer-contract direction            | No special cross-phase consumer contract recorded yet. If a later phase consumes this output, record export shape and import direction before implementation.                                                                                                         |
| Governance-overhead review             | Pending until first real refactor/code-change package closes;<br>then record which governance gates prevented concrete errors and whether later phases can be flatter.                                                                                                |
| Proof rehearsal before implementation  | Keep noOuter closed/root branch separate from hasOuter/open branch. No stochasticity or nonunitarity is genericized.                                                                                                                                                  |
| Expected tactics                       | Prefer exact, rfl, constructor, field projection, small calc blocks, and explicit theorem forwarding. Avoid high-arity index eliminators and broad simp/simpa surfaces.                                                                                               |
| Expected mathlib imports               | No new mathlib imports expected;<br>prefer existing CNNA imports. Verify any new import against mathlib 4.28.0 before use.                                                                                                                                            |
| ExecComplex/computable plan            | No ExecComplex object is introduced unless the phase explicitly touches O00;<br>preserve existing computability boundaries.                                                                                                                                           |
| Concrete computable instance traversal | Infrastructure-only or not prepared yet. Before operational code implementation, name a concrete finite instance and the path from input to output.                                                                                                                   |
| Computable path non-skeleton status    | not-assessed-yet;<br>must be explicit before operational implementation                                                                                                                                                                                               |

| Mathlib complication log               | No phase-specific mathlib complication recorded yet.                                                                                                                                                                                                                  |
| Noncomputable boundary audit           | No phase-specific noncomputable-boundary audit recorded yet.                                                                                                                                                                                                          |
| Mathlib mitigation/refactor layer      | If mathlib introduces noncomputable/classical pressure, isolate in allowed mirror/non-operational layer or backjump to the earliest natural source layer.                                                                                                             |
| Bridge gap status                      | No mathematical bridge expected;<br>missing names/imports must be localized to the natural source/split layer.                                                                                                                                                        |
| Natural backjump/refactor layer        | Backjump to the earliest natural split bucket: inventory, Legacy.StatusGates, CoreSymbols, Legacy.PhaseAliases, or import firewall.                                                                                                                                   |
| Implementation prompt contract         | Use the standardized positive-path implementation workflow: respect all plan sections, import/consumer discipline, derived-only and computable operational path, no forbidden shortcuts, package the full modified code, and verify plan points after implementation. |
| Global no-go inheritance               | yes;<br>all global_no_go_guardrails inherited (GNG01-GNG24)                                                                                                                                                                                                           |
| How implemented                        | No completed implementation record yet. This phase has a prepared scratch-pad entry but must not be marked green until implementation/build evidence exists.                                                                                                          |
| Verification / evidence                | Preparation-only evidence from the YAML master and static audit;<br>no Lean build evidence has been recorded for this phase.                                                                                                                                          |
| Post-implementation plan check         | After implementation/build evidence: update modified/added modules, regenerated module inventory, linked objects, phase status, and exactly one next active cursor.                                                                                                   |
| Artifact packaging rule                | Return a complete zip with all modified files and generated planning artifacts when applicable. Lean build success may be recorded only from an actual current build or from the user-reported local build; otherwise state that local Lean build is required.        |
| Implementation notes                   | Use this record to constrain the next implementation pass. Do not broaden the phase during implementation.                                                                                                                                                            |

|                                      |                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                |

### Phase 1.3.3 – Neutralize complement-family profiles

**Table legend.** G = green/closed and derived-only; W = white/non-direct-Lean tooling/refactor/infrastructure/documentation/comparison; O = orange/implementable after stated predecessor closure; Y = yellow/active and implementable now; R = red/locked Lean-derivation phase; release requires derived-only object/proof evidence. Context class is orthogonal to status.
